PREFACE

This site characterization report addendum was prepared by AECOM Technical Services, Inc. (AECOM) for the Sacramento Municipal Utility District (SMUD) under Master Contract 4600001299, Task Contract 4500121576, Task Number 576-003. The work was initiated by SMUD in accordance with the requirements of the Corrective Action Consent Agreement, Docket Number HWCA P1-13/14-007 between SMUD and the California Department of Toxic Substances Control (DTSC). The work partially relies on information provided by SMUD and information in reports available on the DTSC EnviroStor website. Assumptions based on this data, although believed reasonable and appropriate based on the data provided herein, may not prove to be true in the future as new data are collected.

Approved:

Executive Summary

The Sacramento Municipal Utility District (SMUD) conducted a supplemental site investigation at the SMUD 59th Street Corporation Yard (Site) in accordance with the *Scope of Work for Phase II* within the *First Amendment to Corrective Action Consent Agreement*, Docket HWCA P1-13/14-007 (California Department of Toxic Substances Control [DTSC], 2018). SMUD conducted soil gas and soil sampling in support of selecting and implementing a corrective action for the Site. This Site Characterization Report (SCR) Addendum was prepared by AECOM Technical Services, Inc. (AECOM) on behalf of SMUD to document the work performed and the results from the site investigation activities conducted at the Site from June 2020 through March 2021. This SCR Addendum is a companion document to the SCR (AECOM, 2019), which documented the work performed and the results from site investigation activities conducted at the Site from December 2018 through March 2019.

The Site encompasses 19.74 acres in an area of varied land use. Residential neighborhoods are situated to the west, commercial developments are situated to the north, and United States Highway 50 is located south of the Site. A California Department of Transportation laboratory is located east of the Site. The SMUD headquarters and other buildings of the SMUD campus are located southeast of the Site. The yard is bisected by a Sacramento Regional Transit light rail line and a petroleum product pipeline beneath the light rail right-of-way.

The purpose of the current Site investigation was to further characterize the lateral and vertical extent of volatile organic compounds (VOCs) in soil gas. Additionally, soil sampling was performed to refine the lateral and vertical extent of arsenic-impacted soil requiring remedial action in support of the forthcoming 59th Street Corporation Yard Remedial Action Plan.

Soil Gas. Previous investigations at the Site identified tetrachloroethene (PCE) in soil gas near the Tool Issue Building as a chemical of concern because it is present at concentrations exceeding residential and commercial/industrial soil vapor screening levels (SVSLs). The lateral extent of PCE in soil gas near the Tool Issue Building was previously defined using residential and commercial/industrial SVSLs derived by applying a 0.001 attenuation factor (AF) to the DTSC Human and Ecological Risk Office Human Health Risk Assessment Note 3 ambient air (e.g., indoor air) screening levels (SLs) consistent with DTSC's Vapor Intrusion (VI) Guidance (DTSC, 2011). DTSC later proposed a more conservative AF of 0.03 (California Environmental Protection Agency, 2020) which reduced the SVSLs causing the lateral extent of PCE in soil gas exceeding residential and commercial/industrial SVSLs to no longer be defined. Furthermore, historical concentrations of benzene, chloroform, ethylbenzene, PCE, and trichloroethene (TCE) detected in soil gas at other potential source areas (e.g., Garage Building, Shops Building) that did not previously exceed residential and commercial/industrial SVSLs did exceed the lower commercial/industrial and/or residential SVSLs derived using an AF of 0.03.

Additionally, the laboratory method detection limits (MDLs) associated with 19 VOCs exceeded the lower commercial/industrial and/or residential SVSLs for soil gas samples collected from one of more previous investigation sampling locations. For the instances in which these VOCs were previously reported as not detected above their respective MDLs, it was not known if any of these VOCs were present at concentrations above their respective commercial/industrial and/or residential SVSLs. Also, previous soil gas sample analyses did not include naphthalene, which may be present in soil gas based on the detection of other petroleum-related VOCs (e.g., benzene, ethylbenzene) at concentrations exceeding SVSLs.

Finally, PCE concentrations detected in soil gas at locations around the perimeter of the Tool Issue Building were higher in samples collected from 14.5 feet below ground surface (bgs) than in samples collected from 5.5 feet bgs. The vertical extent of PCE in soil gas near the Tool Issue Building was unknown.

Therefore, additional characterization was necessary to (1) further define the lateral and vertical extent of VOC-impacted soil gas based on the residential and commercial/industrial SVSLs derived using an AF of 0.03, and (2) determine if any of the 19 VOCs that previously had elevated MDLs and naphthalene, which was previously not analyzed for, are present in soil gas at concentrations exceeding commercial/industrial and/or residential SVSLs.

Seventeen analytes (benzene, benzyl chloride, bromodichloromethane [BDCM], chloroform, 1,2-dibromoethane [DBE], 1,2-dichloroethane [DCA], *cis*-1,2-dichloroethene [DCE], 1,2-dichloropropane [DCP], ethylbenzene, n-heptane, hexane, naphthalene, PCE, toluene, TCE, 1,2,3-trichloropropane [TCP], and total petroleum hydrocarbons as gasoline [TPH_g]) were detected at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.03 AF. The highest benzene, benzyl chloride, BDCM, 1,2-DBE, 1,2-DCA, ethylbenzene, n-heptane, hexane, toluene, 1,2,3-TCP, and TPH_g concentrations were detected in soil gas samples collected at 14.5 feet. The highest chloroform, *cis*-1,2-DCE, 1,2-DCP, naphthalene, PCE, and TCE concentrations were detected in shallower soil gas samples collected from 5.5 feet or less. In comparison, only seven of these analytes (benzene, chloroform, 1,2-DBE, *cis*-1,2-DCE, PCE, TCE, and 1,2,3-TCP) were detected at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.001 AF.

The analytes detected in shallow soil gas (i.e., 5.5 feet or less) are of particular interest when evaluating the potential for VI to indoor air. Eleven analytes (benzene, BDCM, chloroform, 1,2-DBE, *cis*-1,2-DCE, 1,2-DCP, ethylbenzene, naphthalene, PCE, TCE, and TPH_g) were detected in shallow soil gas at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.03 AF. In comparison, only five of these analytes (chloroform, 1,2-DBE, *cis*-1,2-DCE, PCE, and TCE) were detected in shallow soil gas at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.001 AF.

PCE in soil gas was previously identified as a chemical of concern (COC) at the Site because of the potential for unacceptable human health risk if soil gas migrated into indoor air (i.e., the VI pathway). This conclusion was based on a 0.001 vapor AF. After evaluating the results of the current investigation, 1,2-DBE, *cis*-1,2-DCE, chloroform, and TCE were identified as additional COCs in soil gas based on a 0.001 AF. When a more conservative 0.03 AF was applied, benzene, BDCM, ethylbenzene, naphthalene, and toluene were also identified as COCs in soil gas.

The lateral extent of VOC concentrations in shallow soil gas exceeding the SVSLs derived using a 0.03 AF extend beneath approximately 9.2 acres in the western two-thirds of the North Corporation Yard and may extend beyond the property boundary to the north, west and south. In comparison, the lateral extent of VOC concentrations in soil gas exceeding the SVSLs derived using a 0.001 AF is limited to two localized areas: in the vicinity of vapor wells SVM-1 and VW14 at the north side of the Tool Issue Building and an area encompassing vapor wells VW19, VW24, and VW30, including the area beneath the western portion of the Garage Building. These two areas comprise approximately 0.65 acre.

The maximum concentration of five soil gas COCs (chloroform, naphthalene, PCE, TCE, and *cis*-1,2-DCE) were detected in soil gas samples collected from 4 to 5.5 feet bgs. The maximum concentration of five soil gas COCs (benzene, ethylbenzene, toluene, BDCM, and 1,2-DBE) were detected in samples collected from 14.5 feet bgs. The vertical extent of these COCs beyond 14.5 feet bgs is not known, except at vapor wells VW14 and VW15, which were installed to depths of 25.5 and 23.5 feet bgs, respectively. Six soil gas COCs (chloroform, ethylbenzene, toluene, PCE, TCE, and cis-1,2-DCE) were detected in the soil gas sample collected from vapor well VW14. Only chloroform, PCE, and TCE were detected at concentrations exceeding their respective SVSLs based on a 0.03 AF, and only PCE was detected at concentration exceeding its SVSL based on a 0.001 AF at this location. Only two soil gas COCs (benzene and toluene) were detected in the soil gas sample collected from vapor well VW15. Only benzene was detected at a concentration exceeding its SVSL based on a 0.03 AF, but it did not exceed its SVSL based on a 0.001 AF at this location.

Soil. Based on previous investigations, arsenic concentrations in soil exceeding the 17.53 milligram per kilogram (mg/kg) background concentration at a depth of 3 feet bgs or less was identified in four areas of the Site with an estimated combined area of approximately 2.6 acres. However, the full extent of these areas was not fully defined. Therefore, additional soil characterization was necessary to refine the lateral and vertical extent of arsenic-impacted soil to support the remedy selection and design.

Based on the current and previous investigations, arsenic concentrations in soil exceeding the 17.53 mg/kg background concentration at a depth of 3 feet bgs or less was identified in five areas of the Site with an estimated combined area of approximately 1.7 acres. The two largest areas of arsenic-impacted soil at a depth of 3 feet bgs or less are located south of the Warehouse Building (approximately 0.9 acre) and in the vicinity of the Salvage Building (approximately 0.6 acre). Three smaller areas of arsenic-impacted soil at a depth of 3 feet bgs or less are located in the vicinity of the Tool Issue Building, west of the Hazardous Material Building, and south of the Garage Building (approximately 0.2 acre combined).

Arsenic concentrations exceeding background in soil at a depth greater than 3 feet bgs were identified in three localized areas: south of the east end of the Warehouse Building (approximately 0.3 acre), south of the Tool Issue Building (approximately 0.03 acre) and west of the Salvage Building (approximately 0.02 acre). In the area south of the east end of the Warehouse Building, the vertical extent of arsenic concentrations exceeding background extends to a depth of at least 10 feet bgs. In the area south of the Tool Issue Building, arsenic concentrations exceeding background extend to a depth between 6 and 11 feet bgs. In the area west of the Salvage Building, the vertical extent of arsenic concentrations exceeding background extend to a depth between 5 and 7.5 feet bgs.

Although the primary focus of the current soil investigation was to further refine the lateral and vertical extent of arsenic-impacted soil to support remedy selection and design, evidence of suspected soil contamination was identified during advancement of vapor well boreholes VW15, VW31, VW35, and VW38. The laboratory analytical results for the soil samples collected from these boreholes, indicated arsenic-impacted soil was present in the vicinity of boreholes VW31 and VW35 west of the Salvage Building. Furthermore, lead and total petroleum hydrocarbons as hydraulic oil/motor oil ($TPH_{ho/mo}$) concentrations exceeding their respective 80 and 2,400 mg/kg residential SLs were identified in a localized area within the area of arsenic-impacted soil west of the Salvage Building. The vertical extent of lead and $TPH_{ho/mo}$ concentrations exceeding their residential SLs extend to a depth between 2 and 5 feet bgs. No significant contamination was identified in the soil samples collected from boreholes VW15 and VW38.

Based on the understanding of site conditions following the 2020-2021 site characterization effort and regulatory SLs in effect at the time, recommended next steps include:

- Conducting additional soil gas sampling at existing vapor wells in the summer for comparison to the winter sampling results from the current investigation to evaluate seasonal and temporal variations and support future risk management decisions.
- Conducting sub-slab vapor sampling beneath existing buildings overlying areas where soil gas COCs were detected at concentrations exceeding their SVSLs to evaluate soil vapor conditions beneath the buildings to further develop lines of evidence regarding soil vapor attenuation at the Site.
- Conducting ambient air sampling of onsite subsurface pipe networks (e.g., sewers, drains, etc.) in areas where detected VOC concentrations in soil gas exceed their SVSLs to assess preferential pathway VI potential.
- Conducting additional soil gas characterization to better define the vertical extent of contamination, if necessary, to support remedial design.
- Implementing a remedial action to address VOC concentrations in soil gas that could pose an unacceptable risk to human health should the vapors migrate into indoor.

- Implementing a remedial action to address arsenic concentrations in soil above background levels, and lead and $TPH_{ho/mo}$ concentrations in soil above their respective SLs.

1.0 Introduction

The Sacramento Municipal Utility District (SMUD) conducted a supplemental site investigation at the SMUD 59th Street Corporation Yard (Site) in accordance with the *Scope of Work for Phase II* within the *First Amendment to Corrective Action Consent Agreement (CACA)*, Docket HWCA P1-13/14-007 (California Department of Toxic Substances Control [DTSC], 2018). Under the CACA, DTSC is the lead regulatory agency and SMUD is the responsible party for corrective action at the Site. SMUD conducted soil gas and soil sampling in support of selecting and implementing a corrective action for the Site. The laboratory analytical data produced from this effort are considered valid and usable for their intended purposes within the constraints of the final usability qualifiers assigned in data quality assessment as detailed in Section 4.2.1. In accordance with Attachment 4 of the CACA, this Site Characterization Report (SCR) Addendum document meets the requirements of preparing and submitting to DTSC an SCR that presents the data, summarizes the findings of the investigation, validates the data, and includes recommendations and conclusions.

This SCR Addendum was prepared by AECOM Technical Services, Inc. (AECOM) on behalf of SMUD to document the work performed and the results from the site investigation activities conducted at the Site from June 2020 through March 2021, which included:

- Installing vapor wells and collecting and analyzing soil gas samples; and
- Advancing shallow boreholes and collecting and analyzing soil samples.

The site investigation was performed according to the methods, protocols, and requirements specified in the *Site Characterization Sampling and Analysis Plan, SMUD 59th Street Corporation Yard* (SAP)(AECOM, 2018), except as noted in the *Site Characterization Sampling and Analysis Plan, SMUD 59th Street Corporation Yard* (SAP Addendum)(AECOM, 2020b), additional soil sampling notification letters in Appendix A, and SAP deviations identified in Section 3.5.

This SCR Addendum is a companion document to the SCR (AECOM, 2019), which documented the work performed and the results from site investigation activities conducted at the Site from December 2018 through March 2019.

1.1 Site Description

The SMUD 59th Street Corporation Yard is the Site addressed in this SCR Addendum. The DTSC EnviroStor website identifies the Site as the SMUD Corporation Yard (EnviroStor Identification Number 34490015). The Site is located at 1708 59th Street in Sacramento, California, approximately 5 miles east of downtown Sacramento (Figure 1-1). The Site is located on the Sacramento East United States (U.S.) Geological Survey Quadrangle Map in Township 8 North, Range 5 East, Section 9 (Mount Diablo Baseline and Meridian). The Site's approximate coordinates are 121 degrees (˚) 26 minutes (') 18 seconds (") West longitude, 38˚ 33' 22" North latitude.

The Site encompasses 19.74 acres in an area of varied land use. Residential neighborhoods are situated to the west, commercial developments are situated to the north, and U.S. Highway 50 is located south of the Site. A California Department of Transportation laboratory is located east of the Site. The SMUD headquarters and other buildings of the SMUD campus are located southeast of the Site. The yard is bisected by the Sacramento Regional Transit (SacRT) light rail Gold Line and a 10-inch diameter petroleum product pipeline beneath the light rail right-of-way (Figure 1-1).

Figure 1-2 presents site features and the land parcels that make up the Site. The main portion of the Site is Assessor's Parcel Number (APN) 008-0010-009-0000 (12.89 acres). The wedge shaped portion of the Site situated south of the light rail line and north of U.S. Highway 50 consists of the following 10 parcels listed west to east: APN

011-0073-001-0000 (0.45 acre), APN 011-0073-002-0000 (1.11 acres), APN 011-0073-003-0000 (0.2 acre), APN 011-0073-004-0000 (0.39 acre), APN 011-0073-006-0000 (0.1 acre), APN 011-0073-008-0000 (1.79 acres), APN 011-0081-001-0000 (0.86 acre), APN 011-0081-002-0000 (0.86 acre), APN 011-0081-003-0000 (0.86 acre), APN 011-0081-008-0000 (0.23 acre). The described wedge-shaped area totals 6.85 acres.

There are eight permanent buildings located on the Site including an office building, inventory warehouse, tool issue building, vehicle maintenance garage, workshops building, hazardous materials building, vehicle storage and salvage building, and a pre-fabrication building. In addition, there are designated areas for the storage of new and refurbished electrical transformers, power poles, power cable, and hazardous wastes. However, since the relocation of SMUD's equipment yard to their East Campus Operations Center, the Site was subsequently used for office space and warehouse storage. The Site lies approximately 30 feet above mean sea level. The Site is within a reclaimed floodplain and is, therefore, flat and generally lacking in any notable natural landform relief. The majority of the Site is surfaced with a minimum of 4-inch thick asphalt or concrete (SMUD, 1989).

1.2 Purpose and Objectives

The purpose of the current Site investigation was to further characterize the lateral and vertical extent of volatile organic compounds (VOCs) in soil gas. Additionally, soil sampling was performed to refine the lateral and vertical extent of arsenic-impacted soil requiring remedial action in support of the forthcoming 59th Street Corporation Yard Remedial Action Plan. The media-specific objectives are described in Sections 1.2.1 and 1.2.2.

1.2.1 Soil Gas

Previous investigations at the Site identified tetrachloroethene (PCE) in soil gas near the Tool Issue Building as a chemical of concern (COC) because it is present at concentrations exceeding residential and commercial/industrial soil vapor screening levels (SVSLs). The lateral extent of PCE in soil gas near the Tool Issue Building was previously defined using residential and commercial/industrial SVSLs derived by applying a 0.001 attenuation factor (AF) to the DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 3 ambient air (e.g., indoor air) screening levels (SLs) consistent with DTSC Vapor Intrusion (VI) Guidance (DTSC, 2011). DTSC later proposed a more conservative AF of 0.03 (California Environmental Protection Agency [CalEPA], 2020) which reduced the SVSLs causing the lateral extent of PCE in soil gas exceeding residential and commercial/industrial SVSLs to no longer be defined. Furthermore, historical concentrations of benzene, chloroform, ethylbenzene, PCE, and trichloroethene (TCE) detected in soil gas at other potential source areas (e.g., Garage Building, Shops Building) that did not previously exceed residential and commercial/industrial SVSLs did exceed the lower commercial/industrial and/or residential SVSLs derived using an AF of 0.03.

Additionally, the laboratory method detection limits (MDLs) associated with the following 19 VOCs exceeded the lower commercial/industrial and/or residential SVSLs for soil gas samples collected from one of more previous investigation sampling locations.

1. Bromodichloromethane (BDCM)
2. Bromomethane
3. 1,3-Butadiene
4. Carbon Tetrachloride

6. alpha-Chlorotoluene (benzyl chloride)
7. 1,2-Dibromoethane (DBE)
8. 1,4-Dichlorobenzene
9. 1,2-Dichloroethane (DCA)
10. 1,2-Dichloropropane (DCP)

11. *cis*-1,3-DCP
12. *trans*-1,3-DCP
13. 1,4-Dioxane
14. Hexachlorobutadiene
15. Methylene chloride
16. 1,1,2,2-Tetrachloroethane
17. 1,2,4-Trichlorobenzene
18. 1,1,2-Trichloroethane
19. Vinyl chloride

For the instances in which these VOCs were previously reported as not detected above their respective MDLs, it was not known if any of these VOCs were present at concentrations above their respective commercial/industrial and/or residential SVSLs. Also, previous soil gas sample analyses did not include naphthalene, which may be present in soil gas based on the detection of other petroleum-related VOCs (e.g., benzene, ethylbenzene) at concentrations exceeding SVSLs.

Finally, PCE concentrations detected in soil gas at locations around the perimeter of the Tool Issue Building were higher in samples collected from 14.5 feet below ground surface (bgs) than in samples collected from 5.5 feet bgs. The vertical extent of PCE in soil gas near the Tool Issue Building was unknown.

Therefore, additional characterization was necessary to (1) further define the lateral and vertical extent of VOC-impacted soil gas based on the residential and commercial/industrial SVSLs derived using an AF of 0.03, and (2) determine if any of the 19 VOCs that previously had elevated MDLs and naphthalene, which was previously not analyzed for, are present in soil gas at concentrations exceeding commercial/industrial and/or residential SVSLs.

1.2.2 Soil

Previous investigations at the Site identified arsenic in soil as a COC because it is present in soil at concentrations exceeding its 0.11 and 0.36 milligram per kilogram (mg/kg) residential and commercial/industrial SLs, respectively, and the 17.53 mg/kg Site-specific background concentration. The arsenic concentrations previously detected in soil above background were limited to four areas within the North Corporation Yard; however, the full extent of these areas was not fully defined. Remedial action is planned for the arsenic-impacted soil as part of the overall Site remedy. Therefore, additional soil characterization was necessary to refine the lateral and vertical extent of arsenic-impacted soil to support the remedy selection and design.

2.0 Background

The following subsections present the Site history, summarize previous site investigations, describe the local geology and hydrogeology, and identify potential exposure pathways for human and ecological receptors.

2.1 Site History

SMUD has operated the 59th Street Corporation Yard since 1947, when it was purchased from the Pacific Gas and Electric Company (PG&E). The Corporation Yard served as a central storage area for hazardous and non-hazardous wastes generated on-site and at other off-site SMUD facilities or sites. Historical uses of the yard by SMUD and PG&E appear to have been the same (Ecology and Environment, 1989).

The SMUD Corporation Yard managed three waste streams. The major waste stream consisted of polychlorinated biphenyls (PCBs) and associated electrical transformers. A second waste stream consisted of Resource Conservation and Recovery Act (RCRA)-regulated wastes, which primarily consisted on spent solvents. A third waste stream consisted of wastes generated at SMUD's various off-site locations within the service area.

Waste oils from electrical transformers, including PCB-contaminated waste oils, accounted for approximately 95 percent of wastes managed on-site. All waste oils were analyzed for PCBs prior to final off-site disposal. Transformers that were removed from service were brought to the Corporation Yard for maintenance. The transformer oil was drained into a tank, and then into 55-gallon drums. The drums were then stored in steel hoppers at the PCB Storage Area pending analytical results. After determination of the PCB content in oil from each drum, the drums were sorted for final disposal. Waste oil that contained less than 5 parts per million (ppm) PCB was recycled. Waste oil that contained between 5 and 10,000 ppm PCB was sent off-site for treatment by decomposition (dechlorination). Waste oil that contained more than 10,000 ppm PCB was sent off-site for incineration (Ecology and Environment, 1989).

RCRA-regulated wastes included spent solvents which were generated by several shops on-site. These wastes were stored on-site for less than 90 days in U.S. Department of Transportation-approved drums prior to shipment to off-site facilities. All drums were appropriately labeled and marked with the start date of accumulation. An inventory identifying the location and date of pickup of each drum was maintained. On or before the 90-day accumulation time limit, the drums were collected and transported to the off-site facility. Transportation of RCRA and PCB wastes was done by SMUD or an independent licensed hauler. As of 1981, waste solvents were sent to recyclers. Prior to 1981, the final disposition of the waste solvents is unknown (Ecology and Environment, 1989).

The third waste stream consisted of wastes which were generated at off-site locations within the service area and were transferred to the main yard for consolidation and appropriate disposal. These wastes included asbestos used for insulation of underground electric lines, herbicides and pesticides used for right-of-way weed control and pest management, wood products (poles and cross members) treated with pentachlorophenol and creosote, and occasional sulfur wastes from SMUD's geothermal projects. Asbestos wastes were stored in double plastic bags and dampened to inhibit mobility of the fibers. Waste solvents were stored in drums in the designated area at the Corporation Yard. Herbicide and pesticide containers were triple rinsed in the field, and empty containers were disposed of at the county landfill. Treated wood products were given away to the public for landscape uses (Ecology and Environment, 1989).

Over the years, SMUD has upgraded both equipment and processes. As a result, PCB fluids and related wastes are no longer generated in significant quantity. The former PCB Storage Area is empty but was previously used for the storage of surplus equipment like insulators, cables, and construction equipment. Hazardous waste activities were

primarily conducted at the HazMat Building, a 90-day storage area for hazardous waste and for the processing and segregation of PCB and non-PCB transformers.

2.2 Previous Investigations and Ongoing Pilot Study

The previous investigations conducted and ongoing pilot study taking place at the Site are summarized in the Sections 2.2.1 through 2.2.7. Tables 2-1 and 2-2 present previous investigation maximum analyte concentrations detected in soil compared to current SVSLs derived using AFs of 0.03 and 0.001, respectively. Table 2-3 presents previous investigation maximum analyte concentrations detected in soil compared to current SLs and, in the case of arsenic, the Site-specific background concentration. Table 2-4 presents previous investigation maximum analyte concentrations detected in groundwater compared to current primary Maximum Contaminant Levels (MCLs).

2.2.1 Underground Storage Tank Removals

Table 2-5 presents an inventory of known historical underground storage tanks (USTs) associated with the Site since 1960. These USTs are described below and their historical locations are presented on Figure 2-1.

Garage Building. Twelve USTs (USTs 77 through 88) built into the floor of the Garage Building are concrete-lined pits (USTs 77 through 87) or a sump (UST 88) for hydraulic oil containment. Installed in 1974, UST 77 is an alignment machine pit with a capacity of 3,500 gallons. Installed in 1963, USTs 78 through 87 are vehicle hoist pits and UST 88 is a sump, each with a capacity of 1,000 gallons (SMUD, 1984; California State Water Resources Control Board [SWRCB], 1988). These pits and sump were either removed in 2020 as part of the vehicle hydraulic lift removals (see Section 2.2.7) or will be removed when the Garage Building is demolished. However, soil sampling beneath pits 77 through 87 and sump 88 was conducted and soil with total petroleum hydrocarbons (TPH) as diesel (TPH_d) and TPH as hydraulic oil/motor oil ($TPH_{ho/mo}$) concentrations detected above SLs was removed.

Six USTs (USTs 89/89D, 90, 96/96D, 97, 98, and 99) were located outside the north and west sides of the Garage Building. Installed in 1981, UST 89 was a 500-gallon capacity tank that stored used oil (SWRCB, 1988). UST 89 was located north of the eastern portion of the Garage Building. USTs 90, 96, 97, and 98 were installed in 1963 and UST 99 was installed in 1960. Located outside the western wall of the Garage Building, USTs 90, 96, 97, 98, and 98 were 500-gallon capacity tanks that stored Stoddard solvent, used oil, transmission fluid, motor oil, and hydraulic oil, respectively (SMUD, 1986; SWRCB, 1988). All six USTs were removed in 1986. USTs 89 and 96 were replaced with 550-gallon capacity tanks designated as USTs 89D and 96D, respectively. UST 96D was installed north of the western side of the Garage Building. USTs 89D and 96D were removed in 2004 (SMUD, 2004).

Shops Building. Three USTs (USTs 1, 2, and 3) were located outside the south side of the western portion of the Shops Building. USTs 1 and 2 were installed in 1972. Each UST had a capacity of 5,000 gallons and stored transformer oil (SMUD, 1986). Both USTs were removed sometime after May 1990. In 2018, a subsurface investigation was conducted to confirm USTs 1 and 2 were no longer present. Geophysical survey methods were used to scan the subsurface where the USTs were located. No metallic anomalies consistent with a UST were identified. The geophysical survey results indicated that an area of soil had been previously excavated to a depth of approximately 4 feet bgs. UST 3 had a capacity of 500 gallons and stored used transformer oil (SMUD, 1986). It is not known when UST 3 was installed; the tank was removed in 1986.

Tool Issue Building. Three USTs (USTs 1/1D, 2, and 3) were located outside the southeast corner of the Tool Issue Building. USTs 1 through 3 were installed in 1973 and each had a capacity of 350 gallons. USTs 1 through 3 stored regular gasoline, Stoddard solvent, and kerosene, respectively (SMUD, 1986). All three USTs were removed in 1986. During the UST removal, a small hole was identified in UST 1 and a strong petroleum odor was noted originating from the northwest corner of the excavation. TPH was detected at a concentration of 2,900 mg/kg in a soil sample collected from the west side of the excavation. Further investigation confirmed the petroleum-impacted

soil was limited in areal and vertical extent suggesting the leak from UST 1 was relatively minor (URS Corporation, 1986). UST 1 was replaced with UST 1D, a 550-gallon capacity unleaded gasoline tank. UST 1D was removed in 2004 (SMUD, 2004).

Vehicle Fueling Station. Up to five USTs (USTs 91/91D, 92, 93/93D, 94/94D, and 95) were present at the vehicle station at one time. USTs 91, 92, and 94 were installed in 1963. UST 91 had a capacity of 10,000 gallons and stored regular gasoline. USTs 92 and 94 each had a capacity of 5,000 gallons and stored unleaded gasoline and diesel fuel, respectively. USTs 93 and 95 were installed in 1974 and 1982, respectively. Both tanks had a capacity of 10,000 gallons and stored regular and unleaded gasoline, respectively (SWRCB, 1988). USTs 91, 92, and 94 were removed in 1986. UST 93 was removed in 1986 or 1987. UST 91 was replaced with UST 91D, which was also had a capacity of 10,000 gallons, but was used to stored unleaded gasoline instead of regular gasoline. USTs 93 and 94 were replaced with USTs 93D and 94D, respectively, which were larger 10,000-gallon capacity tanks that stored unleaded gasoline and diesel fuel, respectively. In late 1990 and early 1991, USTs 91D, 93D, and 94D were replaced with newer tanks with the same capacity and contents as the tanks they replaced. In 2004, USTs 91D, 93D, 94D, and 95 were removed. All but UST 95 were replaced with newer tanks with the same capacity and contents as the tanks they replaced. In 2014, USTs 91D, 93D, and 94D were removed after the Vehicle Fueling Station was decommissioned (Kleinfelder, Inc. [Kleinfelder], 2014b).

Unknown Location. Installed in 1975, UST 100 had a capacity of 200 gallons and stored motor oil (SWRCB, 1988). UST 100 was removed in 1986. The former location of UST 100 is not known.

2.2.2 RCRA Facility Assessment and Investigation

From 2009 to 2012, DTSC conducted a RCRA Facility Assessment to identify and evaluate solid waste management units (SWMUs) and areas of concern (AOCs) at the SMUD Corporation Yard. A SWMU is any discernible waste management unit at a facility from which hazardous waste or hazardous constituents might migrate, irrespective of whether the unit was intended for the management of solid and/or hazardous waste. An AOC is an area that is not a SWMU but which has the potential for hazardous waste or hazardous constituents to be released (DTSC, 2012). DTSC identified the 19 SWMUs and 2 AOCs listed below. Figure 2-2 presents the SWMU and AOC locations.

<u>SWMUs</u>

- SWMU #1: Vehicle Oil/Water Separator (OWS) #1 at the Garage Building
- SWMU #2: Parts Washer west of the Garage Building
- SWMU #3: Lube Room in the Garage Building
- SWMU #4: Parts Washers in the Garage Building
- SWMU #5: Used Oil Aboveground Storage Tank at the Garage Building
- SWMU #6: Battery Room in the Garage Building
- SWMU #7: Diesel Filter Pulse Cleaner along the southwest side of the Garage Building
- SWMU #8: Former Waste Oil UST near northeast corner of the Garage Building
- SWMU #9: Former Waste Oil UST along the north side of the Garage Building
- SWMU #10: Paint Booth and Paint Storage Room in the Carpenter Shop
- SWMU #11: HazMat Used Battery Storage Area
- SWMU #12: HazMat Building
- SWMU #13: Oil Storage Tanks along the west side of the HazMat Building
- SWMU #14: Drained Transformer Staging Area and Universal Waste Storage Area
- SWMU #15: Former Fuel UST near the southeast corner of the Tool Issue Building
- SWMU #16: Former PCB Storage Area

- SWMU #17: Treated Wood Waste Area and Storage Containers
- SWMU #18: Vehicle OWS #2 near the Treated Wood Waste Area
- SWMU #19: Satellite Accumulation Areas in the Garage Building, Shops Building, and Tool Issue Building

AOCs

- AOC #1: Vehicle Fueling Station
- AOC #2: Utility Pole Storage Area

DTSC recommended that Vehicle OWS #1 at the Garage Building (SWMU #1), Vehicle OWS #2 near the Treated Wood Waste Area (SWMU #18), and the Utility Pole Storage Area (AOC #2) be included in a RCRA Facility Investigation (RFI). DTSC recommended no further RCRA corrective action for the other SWMUs and AOC (DTSC, 2012).

Use of OWS #1 was discontinued in 2013. In February 2014, following issuance of the RCRA Facility Assessment Report, Kleinfelder hydrostatically tested OWS #1 and OWS #2, and no evidence of leakage was identified. SMUD submitted a report describing the hydrostatic test procedures and results to DTSC in March 2014 (Kleinfelder, 2014a). Based on the leak testing results, DTSC did not require immediate investigation of the OWSs allowing assessment for potential historical leakage of the two OWSs and ancillary piping to occur at the time of OWS removal. OWS #2 remained in service until just prior to removal in 2020.

In 2015, Kleinfelder performed an RFI for the Utility Pole Storage Area. The RFI assessed whether chemicals applied during wood treatment processes may have migrated from the treated poles to the subsurface. Thirty soil samples were analyzed for TPH; semi-volatile organic compounds (SVOCs), including polycyclic aromatic hydrocarbons and phthalates; metals, and organochlorine pesticides. The RFI Report (Kleinfelder, 2015) concluded that no further investigation is required at the Utility Pole Storage Area. DTSC concurred with the conclusion (DTSC, 2016).

In 2020, OWS #1 and OWS #2 were removed and a ground cavity assessment was performed by SMUD with support from Patriot Environmental Services, Inc. (Patriot), Safety-Kleen Systems, Inc. (Safety-Kleen), Sierra National Construction, Inc. (SNC), and AECOM. In preparation for the OWS removals, Patriot removed residual oil, water, and sludge from both OWSs and pressure-washed the OWS interior sidewalls and bottom. The non-RCRA hazardous waste was transported by Safety-Kleen to their facility in Davis, California. Following cleanout, SMUD inspected the interiors of both OWSs, which were observed to be in good condition with no visible cracks. After SNC removed both OWSs, the resulting ground cavities were inspected by SMUD and soil from the ground cavity sidewalls and bottom was screened by AECOM using a photoionization detector (PID) capable of detecting VOCs in the parts per billion (ppb) concentration range. Limited soil staining and odors were observed around where the inlet pipe had entered OWS #1, and the PID detected VOCs in soil from this northern portion of the ground cavity. With DTSC present to observe, SNC continued to excavate soil from the north end of the OWS #1 ground cavity until VOCs were no longer detected using the PID and DTSC indicated the cavity could be backfilled. At OWS #2, no evidence of contamination (i.e., no staining or odors) was observed and no VOCs were detected in soil from the ground cavity sidewalls and bottom. SMUD concluded no further investigation is warranted and has requested closure of OWS # 1 and OWS #2 (SMUD, 2021a).

2.2.3 Phase II Environmental Site Assessment

In 2015, Kleinfelder performed a Phase II Environmental Site Assessment (ESA) to evaluate areas of the SMUD Corporation Yard where past and/or current activities may have chemically-impacted soil gas, soil, or groundwater, in preparation for possible property redevelopment (Kleinfelder, 2016). Investigation activities included passive soil gas, active soil gas, soil, and groundwater sampling and analysis. PCE was detected in soil gas at concentrations

exceeding the 210 and 2,100 micrograms per cubic meter (µg/m^3) residential and commercial/industrial Environmental Screening Levels (ESLs) (SWRCB, 2013), respectively, in effect at the time. Figure 2-3 presents PCE concentrations detected in soil gas during the Phase II ESA. Arsenic was detected in soil at concentrations ranging from 14 to 110 mg/kg, which exceeded the 0.39 and 1.6 mg/kg residential and commercial/industrial direct contact ESLs, respectively, in effect at the time. Figure 2-4 presents arsenic concentrations detected in soil during the Phase II ESA. Three VOCs (BDCM, chloroform, and PCE) and petroleum hydrocarbons (TPH as diesel [TPH_d], TPH as gasoline [TPH_g], and TPH as motor oil) were detected in groundwater at concentrations that did not exceed their respective primary MCLs, if established. Figure 2-5 presents VOC and TPH concentrations detected in groundwater during the Phase II ESA. Metals including cobalt, copper, nickel, silver, and vanadium were detected in groundwater at concentrations that did not exceed their respective primary MCLs, if established.

2.2.4 2018-2019 Soil Gas, Soil, and Groundwater Investigation

From December 2018 to March 2019, AECOM conducted Site investigation activities to further characterize the lateral and vertical extent of PCE in soil gas, soil, and groundwater and arsenic in soil (AECOM, 2019). The lateral extent of PCE in soil gas was delineated using soil gas data collected from 5.5 feet bgs and the 460 and 2,000 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF in effect at the time. The areal extent of PCE concentrations in soil gas exceeding the residential and commercial/industrial SVSLs were 0.9 and 0.2 acre, respectively, and were partially underlying the Tool Issue Building. Figure 2-3 presents PCE concentrations detected in soil gas during the 2018-2019 soil gas investigation with the lateral extent of PCE approximated using the 15 and 67 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the current 0.03 AF. The lateral extent of PCE exceeding these lower SVSLs is significantly larger and not fully defined, which prompted the current soil gas investigation. PCE was detected in two soil samples at a maximum concentration of 0.0048 mg/kg, which did not exceed its 0.59 and 2.7 mg/kg residential and commercial/industrial SLs, respectively. PCE was detected in groundwater at a maximum concentration of 0.73 microgram per liter (µg/L), which did not exceed its 5 µg/L primary MCL. Figure 2-5 presents PCE concentrations detected in groundwater during the 2018 groundwater investigation.

Figure 2-4 presents arsenic concentrations detected in soil during the 2018 soil investigation. The arsenic concentrations detected in soil during the 2018 soil investigation and earlier investigations were used to derive a Site-specific arsenic background concentration of 17.53 mg/kg (AECOM, 2019). The arsenic concentrations detected in soil above background were primarily limited to the southern portion of the North Corporation Yard. Within this area, the arsenic concentrations exceeding background in soil at a depth of 3 feet bgs or less covered approximately 2.4 acres in the vicinity of the Tool Issue and Salvage Buildings (0.8 acre) and the south side of the Warehouse Building (1.6 acres); however, the full extent of these areas was not fully defined. There were also two smaller areas covering approximately 0.2 acre combined beneath the parking lots to the west of the Hazardous Material Building and south of the Garage Building. Arsenic concentrations exceeding background in soil between a depth of greater than 3 feet to 6 feet bgs occurred in two localized areas: in the vicinity of the Tool Issue Building (approximately 0.2 acre) and in the vicinity of the eastern end of the Warehouse Building, including the area between the building and the SacRT light rail line (approximately 0.3 acre). In the vicinity of the Tool Issue Building, the vertical extent of arsenic concentrations exceeding background appeared to extend down to a depth of at least 6 feet bgs but did not exceed 11 feet bgs. In the vicinity of the eastern end of the Warehouse Building, the vertical extent of arsenic concentrations exceeding background also extended down to a depth of at least 6 feet bgs, but the total depth was unknown. Additional soil characterization was necessary to refine the lateral and vertical extent of arsenic-impacted soil to support the remedy selection and design, which prompted the current soil investigation.

2.2.5 Phase I Environmental Assessment

In 2020, AECOM performed a Phase I ESA of the Site to evaluate potential environmental liabilities resulting from past or current uses (AECOM, 2020a). The Phase I ESA identified five recognized environmental conditions (RECs) associated with the Site. These RECs include the following.

1. The presence of potentially uncharacterized environmental impacts associated with 11 vehicle hydraulic lifts and related hydraulic oil reservoirs in the Garage Building, Vehicle OWS #1 at the Garage Building, and Vehicle OWS #2 near the Treated Wood Waste Area. These features have since been removed and investigated as discussed in Sections 2.2.2 and 2.2.7.
2. Lack of information or documentation regarding the removal of Tool Issue Building USTs 2 and 3. Removal documentation for these USTs has since been found. Removal dates for Tool Issue Building USTs 2 and 3 are provided in Section 2.2.1 and Table 2-5.
3. The presence of PCBs in building materials with concentrations greater than 50 mg/kg. For demolition and disposal purposes, building materials with PCB concentrations greater than or equal to 50 mg/kg are considered PCB bulk product waste under Title 40, Code of Federal Regulations Part 761 and are classified as hazardous waste by DTSC. Any PCB-related work at the Site (e.g., inspection, removal, or clean-up) must be performed by individuals trained and qualified to do so. PCB abatement has since been completed in the Hazmat Building.
4. The presence of potentially uncharacterized PCE in soil gas and the potential for vapor encroachment for buildings within 100 feet of PCE-impacted areas. Additional soil gas characterization for PCE and other VOCs was performed as part of the current investigation and the results are presented in Section 4.2.2.
5. The presence of potentially uncharacterized arsenic in soil. Additional soil characterization for arsenic was performed as part of the current investigation and the results are presented in Section 4.2.3.

2.2.6 Soil Vapor Extraction Pilot Study

In 2020, AECOM initiated a pilot study in the vicinity of the Tool Issue Building to determine whether soil vapor extraction (SVE) would be an effective technology to address VOC contamination in soil gas (AECOM, 2021). The pilot study was conducted in two phases. In May 2020, an initial 5-day pilot test (Phase I) was performed using five SVE wells and a portable SVE unit to evaluate vapor recovery rates obtainable at various applied vacuum pressures and estimate the area of influence and efficiency of a given well or combination of wells. In August 2020, long-term pilot test operation of the SVE system (Phase II) began using information learned from the 5-day pilot test. The SVE system operation is ongoing. Quarterly system monitoring includes collection and analysis of soil gas samples from SVE wells SVE-1 through SVE-5 and vapor monitoring wells SVM-1 through SVM-3. The November 2020 and March 2021 quarterly monitoring events took place concurrently with the current investigation. November 2020 and March 2021 analytical data for soil gas samples collected from vapor monitoring wells SVM-1 through SVM-3 were incorporated into the current investigation soil gas data set.

2.2.7 Garage Building Hydraulic Lift Removal

In 2020, SMUD removed the hydraulic vehicle lifts in the Garage Building. Prior to removal of the lifts, the hydraulic oil was removed. During removal, several of the subsurface hydraulic rams were found to have leaked hydraulic oil. Limited soil excavation was performed to remove contaminated soil. Subsequently, a soil investigation was performed to determine if any additional soil contamination was present. Soil samples were analyzed for TPH, PCBs, and California Administrative Manual (CAM) 17 metals. PCBs and metals were not detected in soil above their respective SLs, except for arsenic; however, the detected arsenic concentration did not exceed the Site-specific background concentration. TPH_d and TPH as hydraulic oil/motor oil ($TPH_{ho/mo}$) were detected in soil above their respective SLs. The TPH_d detections are likely associated with weathered hydraulic oil in the TPH_d carbon range

because diesel was not used in the hydraulic lifts. Additional soil excavation was performed until confirmation soil sample analytical results indicated TPH_d and $TPH_{ho/mo}$ concentrations were below their SLs (SMUD, 2021b).

2.3 Geology

The Site lies within the southern portion of the Sacramento Valley, which was formed from sedimentary deposits that were carried as erosion debris from the surrounding mountain ranges. Much of the area near the Site consists of ancient American River deposits. These sedimentary deposits are of Cretaceous to Quaternary age and are quite deep in the general area (SMUD, 1989). The American River is located approximately 1 mile northeast. The American River is confined on the north by steep bluffs, and its ancient course was likely south of its present course, including the area now occupied by the Site (Ecology and Environment, 1989).

Borehole logs from the Phase II ESA (Kleinfelder, 2016) indicate that several layers of clay, silty clay, clayey silt, silt, silty sand, and sand underlie the Site to a depth of at least 37.5 feet bgs.

2.4 Hydrogeology

Based on data obtained during the Phase II ESA, the depth to first groundwater beneath the Site is approximately 35 feet bgs and flows in a south to southeasterly direction, at a gradient of approximately 0.001 foot per foot (Kleinfelder, 2016). Municipal drinking water wells draw from depths of approximately 100 to 400 feet bgs. Although many municipal wells are located between 2 and 3 miles from the Site, no active drinking water wells were confirmed to exist within 2 miles of the Site. Several private domestic wells were installed within 2 miles of the Site during the 1950s. Well logs for these installations are generally incomplete. Available information indicates that the wells were completed to depths of approximately 75 to 200 feet. The area where these wells are located is now served by the City of Sacramento, which derives its water from groundwater sources more than 2 miles away from the Site and from surface water from the American River and the Sacramento River. Groundwater generally flows in a southwest direction, although it may be affected by the American River. The shallow aquifer has a groundwater flow velocity of approximately 50 to 60 feet per year. The deeper aquifer has a groundwater flow velocity of approximately 10 to 15 feet per year (DTSC, 2012).

2.5 Potential Exposure to Human and Ecological Receptors

Residential neighborhoods are located adjacent to the Site on the western boundary, north of Folsom Boulevard north of the Site, and south of U.S. Highway 50 south of the Site. Seven schools are located within approximately 0.5 mile from the Site (DTSC, 2012). Surface runoff from the Site is collected by storm drains and transported by the sewer system for off-site treatment. The Site is not open to public access, so exposure to contaminated media on Site would be restricted to SMUD personnel. The Site is considered to be unsuitable habitat for ecological receptors due to its highly developed nature.

Based on soil sampling performed at the Site, the primary risk driver from soil exposure is arsenic. Potential exposure routes for soil include inhalation of soil particulates and direct contact via incidental ingestion and dermal contact. The majority of the Site is covered with buildings and pavement; therefore, current Site workers are unlikely to be exposed to soil at the Site unless they are involved in landscape maintenance in unpaved areas or construction activities involving excavation, trenching, or pavement removal. Site personnel engaging in activities that could result in inhalation of soil particulates or direct soil contact can minimize their potential risk by reducing dust generation, wearing personal protective equipment, and following good sanitation practices.

Based on groundwater sampling performed at the Site, the primary risk driver from groundwater exposure is PCE. Potential groundwater exposure routes include direct contact via ingestion and dermal contact. Groundwater is located at approximately 35 feet bgs and there are no water wells located on Site; therefore, these exposure

pathways are currently incomplete for Site workers. Additionally, PCE concentrations detected in groundwater are below the 5.0 µg/L primary MCL; therefore, the PCE concentrations in groundwater are within acceptable limits for potable use should the groundwater be extracted for such use in the future.

Current indoor workers may be exposed to volatile chemicals through the VI pathway. In December 2016, SMUD performed an indoor air quality assessment at the Tool Issue Building for VOCs, mold, and dust. PCE was not detected in the indoor air samples collected from the Tool Issue Building. SMUD proceeded with collection of additional indoor air samples from the Tool Issue Building in April 2019 following review of the 2018 soil gas investigation findings to determine if there is unacceptable indoor air risk to building occupants from PCE and its associated degradation products. PCE was detected in 2 of 6 indoor air samples collected; however, the detected concentrations were less than the 0.46 µg/m^3 residential ambient air SL (DTSC, 2020). *cis*-1,2-Dichloroethene (DCE) was the only PCE degradation product detected. *cis*-1,2-DCE was detected in 1 of 6 indoor air samples collected, and the detected concentration was less than the 8.3 µg/m^3 residential ambient air SL (DTSC, 2020).

3.0 Site Investigation Scope, Approach, and Methods

The following subsections describe the Site investigation scope and approach, field and analytical methods, quality assurance (QA)/quality control (QC) measures, and SAP deviations.

3.1 Scope and Approach

The Site investigation activities conducted from June 2020 through March 2021 included soil gas and soil sampling (hereinafter referred to as the current investigation). The current investigation scope and approach for soil gas and soil sampling are described in Sections 3.1.1 and 3.1.2, respectively.

3.1.1 Soil Gas Investigation

As discussed in Section 1.2.1, additional soil gas characterization was necessary to (1) further define the lateral and vertical extent of VOC-impacted soil gas based on the residential and commercial/industrial SLs derived using an AF of 0.03, and (2) determine if any of the 19 VOCs that had elevated MDLs during the Phase II ESA and naphthalene, which was not previously analyzed for in soil gas, are present in soil gas at concentrations exceeding commercial/industrial and/or residential SLs. Table 3-1 lists soil gas samples collected during the current investigation, their respective sample depths, and analyses performed. Soil gas sampling locations are shown on Figure 3-1.

The current investigation soil gas sampling approach was to initially collect soil gas samples from 29 permanent vapor well locations (VW14 through VW42) spaced approximately 100 feet or less apart. Vapor monitoring wells VW14 and VW15 were proposed as single-completion wells with a sampling probe placed at 25.5 feet bgs. Vapor monitoring wells VW16 through VW42 were proposed as dual-completion wells with sampling probes placed at 5.5 and 14.5 feet bgs. A single round of soil gas sampling was planned with the sample analysis for VOCs at a fixed laboratory using United States Environmental Protection Agency (USEPA) Method Toxic Organics (TO)-15.

Subsequently, additional vapor monitoring wells were proposed to be installed by stepping out from locations where elevated VOC concentrations (i.e., greater than the commercial/industrial and/or residential SVSLs) were detected to further define the lateral extent of impact. Potential step-out locations were proposed to be approximately 100 feet or less from the location being stepped out from. Based on the soil gas analytical results from vapor monitoring wells VW16, VW19, VW20, VW25, VW26, VW30, VW31, VW34, VW35, VW36, and VW39 through VW42, 15 step-out vapor monitoring wells (VW43 through VW57) were installed with vapor probes at 5.5 and 14.5 feet bgs. These step-out wells were placed to the west and east of the initially-installed vapor wells.

The soil gas sampling approach included a contingency in the event that the soil cores collected during vapor well borehole advancement suggested the presence of VOC-impacted soil (e.g., staining or elevated PID readings). If the presence of VOC-impacted soil was suspected, the proposed sampling probe depth would be modified so that the actual sampling probe depth corresponded to the depth of suspected VOC-impacted soil. However, no suspected VOC-impacted soil was observed below 5 feet bgs; therefore, the soil vapor probes were installed at their default depths of 5.5 and 14.5 feet bgs. Suspected VOC-impacted soil was identified at 2 feet bgs in four boreholes (VW15, VW31, VW35, and VW38); however, 2 feet bgs was too shallow to install a vapor sampling probe. Instead, samples of the suspected VOC-impacted soil were collected for laboratory analysis as described in Section 3.1.2.

3.1.2 Soil Investigation

As discussed in Section 1.2.2, remedial action is planned for the arsenic-impacted soil as part of the overall Site remedy. Therefore, additional soil characterization was necessary to refine the lateral and vertical extent of arsenic-impacted soil to support the remedy selection and design. Table 3-2 lists the soil samples collected during the

current investigation, their respective sample depths, and analyses performed. Soil sampling locations are shown on Figure 3-2. Soil sampling was conducted during vapor well installation if evidence of soil contamination was identified (e.g., stained soil, odor, elevated VOC field measurement). However, the primary scope of soil sampling during the current investigation was to refine the extent of arsenic impacts in areas where remedial action is planned.

Phase 1 Step-Out Boreholes. On June 22, 2020, SMUD submitted a letter (Appendix A) to the DTSC project manager notifying him of SMUD's intentions to conduct additional soil sampling at depths of 1.5 and 3 feet bgs in four areas (south of the Garage Building, east-northeast of the Tool Issue Building, southeast of the Salvage Building, and west of the Hazardous Material Building) to refine the extent of arsenic impacts. South of the Garage Building, four step-out boreholes (KA-44-N, KA-44-S, KA-44-E, and KA-44-W) were proposed at a distance 15 feet to the north, south, east, and west from previous investigation borehole KA-44. East-northwest of the Tool Issue Building, three step-out boreholes (KA-17-N, KA-17-E, and KA-17-W) were proposed at a distance 15 feet to the north, east, and west from previous investigation borehole KA-17. Southeast of the Salvage Building, four step-out boreholes (B08-N, B08-S, B08-E, and B08-W) were proposed at a distance 15 feet to the north, south, east, and west from previous investigation borehole B08. West of the Hazardous Material Building, three step-out boreholes (KA-10-N, KA-10-S, and KA-10-W) were proposed at a distance 15 feet to the north, south, and west from previous investigation borehole KA-10. Soil sampling was performed on June 29 and 30, 2020. Following review of the analytical results, SMUD decided to conduct additional soil sampling.

Phase 2 Step-Out Boreholes. On July 15, 2020, SMUD submitted a letter (Appendix A) to the DTSC project manager notifying him of SMUD's intentions to conduct additional soil sampling at 1.5 feet bgs in three areas (east-northeast of the Tool Issue Building, southeast of the Salvage Building, and west of the Hazardous Material Building) to further refine the extent of arsenic impacts. East-northwest of the Tool Issue Building, three step-out boreholes (KA-17-NN, KA-17-NW, and KA-17-WW) were proposed to the north, northwest, and west from previous investigation borehole KA-17 beyond the Phase 1 step-out boreholes. Southeast of the Salvage Building, three step-out boreholes (B08-NN, B08-SS, and B08-EE) were proposed to the north, south, and east from previous investigation borehole B08 beyond the Phase 1 step-out boreholes. West of the Hazardous Material Building, three step-out boreholes (KA-10-SS, KA-10-SW, and KA-10-WW) were proposed to the south, southwest, and west from previous investigation borehole KA-10 beyond the Phase 1 step-out boreholes. Soil sampling was performed on July 20, 2020. Following review of the analytical results, SMUD decided to conduct additional soil sampling.

Phase 3 Step-Out Boreholes. SMUD proposed to conduct additional soil sampling at 1.5 feet bgs in three areas (east-northeast of the Tool Issue Building, southeast of the Salvage Building, and west of the Hazardous Material Building) to further refine the extent of arsenic impacts. East-northwest of the Tool Issue Building, four step-out boreholes (KA-17-3-N, KA-17-3-NE, KA-17-3-NW, and KA-17-3-W) were proposed to the north, northeast, northwest, and west from previous investigation borehole KA-17 beyond the Phase 2 step-out boreholes. Southeast of the Salvage Building, three step-out boreholes (B08-3-N, B08-3-S, and B08-3-E) were proposed to the north, south, and east from previous investigation borehole B08 beyond the Phase 2 step-out boreholes. West of the Hazardous Material Building, one step-out borehole (KA-10-3-S) was proposed to the south from previous investigation borehole KA-10 beyond the Phase 2 step-out boreholes. Soil sampling was performed on August 7, 2020. Following review of the analytical results, SMUD decided to conduct additional soil sampling.

Phase 4 Step-Out Borehole. SMUD proposed to conduct additional soil sampling at 1.5 feet bgs in one area (east-northeast of the Tool Issue Building) to further refine the extent of arsenic impacts. One step-out borehole (KA-17-4-NE) was proposed to the northeast from previous investigation borehole KA-17 beyond Phase 3 step-out borehole KA-17-3-NE. Soil sampling was performed on August 28, 2020.

Warehouse Building Step-Out Boreholes. On November 2, 2020, SMUD submitted a letter (Appendix A) to the DTSC project manager notifying him of SMUD's intentions to conduct additional soil sampling at a depth of 1.5 feet bgs within and around the Warehouse Building to refine the extent of arsenic impacts. A total of 12 boreholes were proposed, including three boreholes within the Warehouse Building, two boreholes along the southern loading dock (WB01 and WB02), two boreholes in the parking stalls south of the loading dock (WB03 and WB04), three boreholes in the area southeast of the Warehouse Building (WB05 through WB07), and two boreholes near the estimated western extent of arsenic impacts. The proposed locations for the two western boreholes were in close proximity to the proposed locations for vapor wells VW56 and VW57; therefore, soil samples for arsenic analysis were collected from these vapor well boreholes instead of advancing two more boreholes nearby. Soil sampling was performed on December 21 and 22, 2020. Following review of the analytical results, SMUD decided to conduct additional soil sampling.

Vapor Well Boreholes. In December 2020, during the installation of vapor monitoring wells VW15, VW31, VW35, and VW38, shallow soil samples were collected when evidence of soil contamination was identified (e.g., stained soil, odor, elevated PID readings). The soil samples were analyzed for VOCs, SVOCs, TPH, PCBs, and CAM 17 metals. Following review of the analytical results, SMUD decided to conduct additional soil sampling near boreholes VW31 and VW35. As further discussed in Section 4.2.3, arsenic was detected at concentrations exceeding its Site-specific background concentration in the soil samples collected from boreholes VW31 and VW35. Additionally, lead, TPH_d, and $TPH_{ho/mo}$ were detected at concentrations exceeding their respective residential SLs in the soil sample collected from borehole VW35.

Vapor Well Borehole Step-Outs and Warehouse Building Phase 2 Borehole Step-Outs. On February 17, 2021, SMUD submitted a letter (Appendix A) to the DTSC project manager notifying him of SMUD's intentions to conduct additional soil sampling in two areas (adjacent to the Salvage Building and adjacent to the Warehouse Building). Adjacent to the Salvage Building, four step-out boreholes (VW35-N, VW35-S, VW35-E, and VW35-W) with soil samples at 2 feet bgs were proposed at a distance 15 feet to the north, south, east, and west from borehole VW35 to further define the lateral extent of arsenic, lead, TPH_d, and $TPH_{ho/mo}$. Additionally, one step-out borehole (VW31-S) with a soil sample at 2 feet bgs was proposed at a distance 15 feet south from borehole VW31 to further define the lateral extent of arsenic. Adjacent to the Warehouse Building, five step-out boreholes (WB08 through WB12) were proposed. Boreholes WB08 and WB09 were located on the southern loading dock and were step-outs from previous investigation boreholes KA-48 and B11, respectively. Borehole WB10 was placed at approximately the same location as previous investigation borehole B17 in order to further define the vertical extent of arsenic at this location. Step-out boreholes WB11 and WB12 were placed to the north of borehole WB06 and east of borehole WB07, respectively. For this sampling event, SMUD proposed using a handheld x-ray fluorescence (XRF) analyzer to field screen soil samples for arsenic prior to submittal to the laboratory for analysis. XRF field readings facilitate real-time decisions to determine if collection of additional soil samples should be considered. Soil sampling was performed February 22 through 24, 2021. Upon reviewing the XRF readings for soil samples collected from boreholes VW35-N and VW35-S, SMUD proceeded with advancing two additional boreholes (VW35-NN and VW35-SS) to the north and south during the same mobilization.

3.2 Field Methods

This section provides an overview of the field methods used to conduct the site investigation. Detailed procedures are presented in the SAP (AECOM, 2018) and SAP Addendum (AECOM, 2020b). The field investigation was performed by AECOM with support from B&B Locating, Inc. (B&B) and Confluence Environmental, Inc. (Confluence) (C-57 License #913194). B&B provided subsurface utility locating services. Confluence provided pavement coring, hand augering, soil sampling, borehole destruction, pavement patching, direct-push technology (DPT), and vapor well installation services.

3.2.1 Site Reconnaissance and Proposed Sample Location Marking

In preparation for the field investigation, AECOM met with SMUD's project manager and in-house utility clearance personnel to review and mark sampling locations. The asphalt or pavement was marked using white paint to indicate the proposed borehole and vapor well locations. Prior to marking the locations, reconnaissance was performed in the area surrounding each proposed borehole or vapor well location to look for surface evidence of subsurface utilities (e.g., utility vaults, manholes, light poles) or other possible hazards such as overhead utility lines. If a potential hazard was identified, the affected proposed borehole or vapor well location was adjusted to avoid the hazard.

3.2.2 Subsurface Utility Clearance

AECOM contacted Underground Service Alert of Northern California and Nevada (USA North 811) at least 2 working days prior to initiation of subsurface activities to notify utility service providers of the work to be performed and allow them to mark any utility lines that may be present on Site. USA North 811 Ticket Numbers X017001791 (valid June 22 through August 13, 2020), X032202757 (valid November 23, 2020 through February 4, 2021), and X104704066 (valid February 18 through March 16, 2021) were issued during the course of the site investigation. B&B conducted subsurface utility clearances at proposed borehole and vapor well locations. If a subsurface utility line or unknown subsurface hazard was identified during the subsurface utility clearance, the affected proposed borehole or vapor well location was adjusted to avoid the hazard.

3.2.3 Permitting

AECOM obtained well permits from the Sacramento County Environmental Management Department (SCEMD). Permits 62027 through 62055 applied to the initial 29 vapor wells (VW14 through VW42). Permits 62056-A through 62056-O applied to 15 step-out vapor wells (VW43 through VW57). AECOM coordinated with SCEMD to schedule an inspector when required and provided SCEMD with daily status updates while work covered by the well permits was being performed.

3.2.4 Borehole Advancement and Soil Sampling

Boreholes intended for vapor well installation (VW14 through VW57) were initially advanced by Confluence to 5 feet bgs using a 3.5-inch diameter hand auger. Soil lithology for the initial 5 feet was logged by the field geologist using the soil cuttings removed from the borehole. Beyond 5 feet bgs, the boreholes were advanced by Confluence using a DPT rig. DPT involves advancing a sampling probe by direct hydraulic pressure or percussion using small diameter rods. Continuous soil cores were collected in acetate liners from 5 feet bgs to the total borehole depth for lithologic description, except at deeper boreholes VW14 and VW15, where continuous soil cores were collected from 15 feet bgs to the total borehole depth. A PID was used to screen the hand auger soil cuttings and DPT soil cores for VOCs. Soil samples for laboratory analysis were not collected from vapor well boreholes, except at boreholes VW15, VW31, VW35, and VW38. Soil samples for laboratory analysis were collected from these four boreholes at 2 feet bgs because evidence of possible contamination (e.g., soil staining/discoloration, odor, PID readings indicating VOC concentrations above background) was identified at this depth in the field. The soil samples for laboratory analysis were collected using the hand auger bucket and placed into glass sample jars.

Boreholes intended for soil sampling only (i.e., no vapor well installation) were advanced to total depth using a 3.5-inch diameter hand auger. This included boreholes advanced by Confluence on June 29 and 30, 2020; July 20, 2020; August 7 and 28, 2020; December 21 and 22, 2020; and February 22 through 24, 2021. Soil lithology was not logged for these shallow boreholes because the soil lithology for shallow soil across the site was logged during previous investigations. The current investigation boreholes were step-outs from these previous investigation boreholes, or step-outs from boreholes for which soil lithology was logged as part of the current investigation vapor well installation effort. Soil samples intended for laboratory analysis were collected at the target depth intervals using

the hand auger bucket and placed into glass sample jars. At borehole WB01, refusal was encountered between 0.5 and 1.5 feet below surrounding grade. Therefore, a second borehole (WB01A) was advanced adjacent to borehole WB01 in order to collect a soil sample from 1.5 feet below surrounding grade.

In February 2021, a Bruker S1 TITAN Series handheld XRF analyzer was used to field screen soil samples for lead and/or arsenic to facilitate real-time decisions regarding the need to collect deeper soil samples and when to step-out laterally and advance additional boreholes. Soil samples were submitted to the project laboratory to confirm the XRF screening results.

3.2.5 Vapor Monitoring Well Installation and Soil Gas Sampling

Confluence constructed vapor monitoring wells VW16A/B, VW19A/B, VW20A/B, VW24A/B through VW26A/B, VW30A/B through VW32A/B, and VW34A/B through VW42A/B from November 23 through 25, 2020 and vapor monitoring wells VW14, VW15, VW17A/B, VW18A/B, VW21A/B through VW23A/B, VW27A/B through VW29A/B, VW33A/B, VW43A/B through VW57A/B from December 15 through 18 and 21, 2020. All vapor monitoring wells were installed in areas paved with asphalt or concrete of varying thicknesses ranging from 2 to 9 inches. To ensure that the shallowest vapor probes were installed at least 5 feet below the top of the soil, all vapor well construction specification depths were referenced to the bottom of pavement/top of soil (i.e., the bottom of pavement/top of soil = 0 feet bgs). Vapor monitoring wells VW14 and VW15 were constructed by placing vapor probes at depths of 25.5 and 23.2 feet bgs, respectively, within a 1-foot sand pack (intervals of 25 to 26 and 22.7 to 23.7 feet bgs, respectively). The vapor probe for vapor monitoring well VW15 was placed at 23.5 feet bgs instead of its planned depth of 25.5 feet bgs because a clay layer was encountered at 24 feet bgs and extended to at least 26 feet bgs; therefore, the probe was placed above this clay layer. Vapor monitoring wells VW16A/B through VW57A/B were constructed by placing vapor probes at depths of 5.5 and 14.5 feet bgs within a 1-foot thick sand pack (intervals of 5 to 6 and 14 to 15 feet bgs). Vapor well designation “A” was assigned to probes at 5.5 feet bgs, and vapor well designation “B” was assigned to probes at 14.5 feet bgs.

Approximately 1 foot of dry granular bentonite was placed above each sand pack. Additional dry granular bentonite was placed in 1-foot lifts and hydrated to form a seal between the lower sampling depth and the upper sampling depth and between the upper sampling depth and the ground surface. Each probe had 1/4-inch diameter Teflon™ tubing extending to the ground surface to enable sample collection from the target depths. A dedicated gas-tight three-way valve was attached to the end of the exposed tubing to facilitate connection of sampling equipment and to seal the tubing when not in use. A flush-mount well box was installed at the surface to protect the exposed tubing and valve.

On November 16, 2020, AECOM collected soil gas samples from existing vapor monitoring wells SVM-1 through SVM-3 as part of the fall 2020 quarterly SVE system monitoring event. From November 30 through December 4, 2020, AECOM collected soil gas samples from the vapor monitoring wells that were installed in November 2020. On December 22, 23, 29, and 30, 2020, AECOM collected soil gas samples from the vapor monitoring wells installed in December 2020. All soil gas samples were collected using 1.4-liter passivated stainless steel canisters.

New vapor wells were allowed to equilibrate for a minimum of 48 hours prior to soil gas sampling. Soil gas sampling was not performed unless at least 5 days had passed following a significant rain event (i.e., 1/2 inch or greater of rainfall during a 24-hour period). Additionally, the SVE system was temporarily shut down at least 2 days prior to soil gas sampling. A shut-in test was conducted prior to purging/sampling to check for leaks in the aboveground sampling system. In order to remove stagnant air from the sampling system, three volumes of air corresponding to the void space in the sample tubing and pore space of the sand pack were purged prior to sample collection. A leak test was conducted each time a sample was collected to evaluate whether an adequate seal was established in the sampling train and at the soil vapor probe interface with the ground surface. Helium and isopropyl alcohol were used to test for ambient air leaks. A helium detector was used to monitor for leaks during the leak test. Isopropyl alcohol

was included in the USEPA Method TO-15 analyte list to identify any leaks that may have occurred during sample collection.

AECOM collected additional soil gas samples from vapor monitoring wells VW24A, VW30A, VW30B, VW42A, VW45A, VW48A, VW49A, VW57B, and SVM-1 through SVM-3 on March 3 and 4, 2021 using 1.4-liter passivated stainless steel canisters. Duplicate soil gas samples were collected from vapor well VW24A to confirm a PCE concentration detected above the commercial/industrial SVSL in the initial soil gas sample collected from this well. Soil gas samples were collected from vapor wells VW30A and VW30B to confirm BDCM and chloroform concentrations detected above commercial/industrial SVSLs in the initial soil gas samples collected from these wells. Soil gas samples were collected from vapor wells VW42A and VW57B to confirm TPH_g concentrations detected above commercial/industrial and/or residential SVSLs in the initial soil gas samples collected from these wells. A soil gas sample was collected from vapor well VW45A to confirm a benzene concentration detected above the commercial/industrial SVSL in the initial soil gas sample collected from this well. A soil gas sample was collected from vapor well VW48A to confirm a PCE concentration detected above the residential SVSL in the initial soil gas sample collected from this well. A soil gas sample was collected from vapor well VW49A to confirm chloroform and PCE concentrations detected above residential SVSLs in the initial soil gas sample collected from this well. Soil gas samples were collected from vapor wells SVM-1 through SVM-3 as part of the winter 2021 quarterly SVE monitoring event.

3.2.6 Soil Investigation Borehole Destruction

Boreholes advanced as part of the soil investigation were destroyed immediately following soil sample collection by backfilling each hole with the soil cuttings that originated from that hole. A tamping bar was used to compact the backfilled soil. In paved areas, the pavement was patched by placing cement from the top of the backfilled soil to the top of the surrounding pavement.

3.2.7 Land Surveying

Borehole and vapor well locations were determined by measuring distances from previously surveyed boreholes and other previously mapped site features.

3.2.8 Investigative-Derived Waste Management and Disposal

Investigative-derived waste (IDW) included hand auger cuttings (e.g., soil) and soil cores from vapor well installation, acetate liners, disposable personal protective equipment (e.g., nitrile gloves, ear plugs, Tyvek® coveralls), and paper towels. Soil IDW from vapor well installation was consolidated with soil IDW from a concurrent environmental investigation of hydraulic vehicle lifts within the Garage Building. The soil IDW was managed, characterized, and disposed of as part of the Garage Building hydraulic lift investigation and will be documented in the forthcoming Garage Building Hydraulic Lift Removal Report. All other IDW was disposed of as general refuse in a garbage dumpster located on Site.

3.3 Analytical Methods

Soil gas and soil samples collected for laboratory analysis were submitted to BC Laboratories in Bakersfield, California, following chain-of-custody protocol. Soil gas samples collected from vapor monitoring wells VW14, VW15, VW16A/B through VW57A/B, and SVM1 through SVM-3 were analyzed for VOCs by USEPA Method TO-15. The laboratory reported a full suite of VOC analytes for each soil gas sample, except the soil gas samples collected from vapor wells SVM-1 through SVM-3 in November 2020, which had a VOC analyte list limited to chlorinated ethenes and ethanes consistent with the SVE system monitoring requirements. The VOC analyte list for the soil gas samples collected from vapor wells SVM-1 through SVM-3 in March 2021 was expanded to include a full suite of VOCs so

the data could be used in the human health risk assessment of the VI pathway in addition to monitoring the SVE system progress.

Soil samples collected from boreholes VW35-E, VW-35-N, VW-35-NN, VW-35-S, VW-35-SS, and VW-35-W were analyzed for arsenic and lead by USEPA Method SW6020 and TPH by USEPA Method SW8015B. Soil samples collected from boreholes VW15, VW31, VW35, and VW38 were analyzed for CAM 17 metals by USEPA Methods SW6020 and either SW6020A (VW15) or SW7471A (VW31, VW35, and VW38), TPH by USEPA Method SW8015B, PCBs by USEPA Method SW8082, VOCs by USEPA Method SW8260B, and SVOCs by USEPA Method SW8270C. Soil samples collected all other boreholes were analyzed for arsenic by USEPA Method SW6020.

CAM 17 metals analytes include antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc. TPH analytes include light naptha, heavy naptha, aviation gas, Stoddard solvent, gasoline (TPH_g), jet fuel (JP4, JP5, JP8), kerosene, diesel (TPH_d), fuel oil #6, crude oil, hydraulic oil/motor oil ($TPH_{ho/mo}$), and WD-40®.

3.4 Quality Assurance/Quality Control

QA/QC samples collected in the field included field duplicates. Ten field duplicate sample pairs were collected for soil gas and are listed below. These sample pairs were collected from vapor monitoring wells VW17A, VW21A, VW24A, VW32A, VW37B, VW38B, VW41A, VW50A, VW53A, and VW57B and analyzed for VOCs.

- SG-VW17B-01 and SG-VW17B-02
- SG-VW21A-01 and SG-VW21A-02
- SG-VW24A-02 and SG-VW24A-03
- SG-VW32A-01 and SG-VW32A-02
- SG-VW37B-01 and SG-VW37B-02
- SG-VW38B-01 and SG-VW38B-02
- SG-VW41A-01 and SG-VW41A-02
- SG-VW50A-01 and SG-VW50A-02
- SG-VW53A-01 and SG-VW53A-02
- SG-VW57B-01 and SG-VW57B-02

Eleven field duplicate sample pairs were collected for soil and are listed below. These sample pairs were collected from boreholes B08-N, B08-3-N, KA-10-S, KA-10-WW, KA-44-W, VW-31-S, VW35-S, VW35-SS, WB01, WB06, and WB11. The sample pairs collected from boreholes VW-35-S and VW-35-SS were analyzed for arsenic, lead, and TPH. The sample pairs collected from the other eight boreholes were analyzed for arsenic.

- B08-N-1.5 and B08-N-1.5-FD
- B08-3-N-1.5 and B08-3-N-1.5-FD
- KA-10-S-3 and KA-10-S-3-FD
- KA-10-WW-1.5 and KA-10-WW-1.5-FD
- KA-44-W-1.5 and KA-44-W-1.5-FD
- VW-31-S-5 and VW-31-S-5-FD
- VW-35-S-5 and VW-35-S-5-FD
- VW-35-SS-5 and VW-35-SS-5-FD
- WB01-0.5 and WB01-0.5-FD
- WB06-5 and WB06-5FD
- WB11-5 and WB11-5-FD

Leak-check compound isopropyl alcohol was detected above the laboratory practical quantitation limit (PQL) in the soil gas samples collected from vapor wells VW18B, VW21B, VW24A, VW28B, VW30A/B, VW46B, VW51B, VW53A, and VW56A/B. If the detected concentration of the leak check compound is greater than or equal to 10 times the laboratory PQL for the target analyte(s), then corrective action is necessary according to Section 4.2.2.1 of the *Advisory – Active Soil Gas Investigations* (CalEPA, 2015). The isopropyl alcohol concentrations detected in three soil gas samples (42 µg/m^3 in sample SG-VW28B-01, 35 µg/m^3 in sample SG-VW46B-01, and 94 µg/m^3 in sample SG-VW56A-01) exceeded 10 times the lowest laboratory PQL for the target analytes in their respective samples. Although this would normally trigger corrective action, no corrective action is needed because two leak check compounds were used and the other leak check compound (helium) was not detected during the leak tests; therefore, a leak was not confirmed. Additionally, isopropyl alcohol was detected in soil gas samples collected from vapor wells SVM-1 through SVM-3 where isopropyl alcohol was not used as a leak-check compound. This suggests the isopropyl alcohol detections were either site related or a result of equipment contamination and not leak related.

3.5 Sampling and Analysis Plan Deviations

Deviations from the SAP (AECOM, 2018), SAP Addendum (AECOM, 2019), and soil sampling notification letters (Appendix A) are described in the bullets below. These deviations are not considered to have affected the project data quality objectives (DQOs) in a negative way, and in some cases were necessary to achieve the project DQOs.

- **The vapor sampling probe for vapor monitoring well VW15 was placed at 23.5 feet bgs instead of its planned depth of 25.5 feet bgs.** SAP Addendum Section 4.1 states the proposed vapor sampling probe depth for vapor monitoring well VW15 was 25.5 feet bgs; however, a clay layer was encountered at 24 feet bgs and extended to at least 26 feet bgs. To avoid this low permeability zone and provide a higher quality soil gas sample, the probe was placed immediately above this clay layer.
- **Proposed boreholes within the Warehouse Building were not advanced.** Figure 1 attached to the November 2, 2020 soil sampling notification letter shows three proposed borehole locations within the Warehouse Building. These boreholes were proposed to define the northern extent of arsenic impacts in the Warehouse Building vicinity if the soil samples collected from boreholes WB01 and WB02 along the southern loading dock indicated arsenic impacts extended under the Warehouse Building. The analytical results for the soil samples collected from boreholes WB01 and WB02 indicated that step-out boreholes inside the Warehouse Building were not needed. Instead, two additional boreholes (WB08 and WB09) were advanced along the southern loading dock to further refine the northern extent of arsenic impacts along the south side of the Warehouse Building.
- **Soil samples collected from the borehole VW31 and VW35 step-out locations and Warehouse Building step-out locations were not analyzed for CAM 17 metals.** Soil samples collected from the borehole VW31 step-out location (VW31-S) and the Warehouse Building step-out locations (WB08 through WB12) were analyzed for arsenic by USEPA Method SW6020. Soil samples collected from the borehole VW35 step-out locations (VW35-N, VW35-S, VW35-E, VW35-W, VW35-NN, and VW35-SS) were analyzed for arsenic and lead by USEPA Method SW6020. The February 17, 2021 additional soil sampling notification letter incorrectly indicated soil samples from these boreholes would be analyzed for CAM 17 metals by USEPA Methods SW6020 and SW7471A. The letter should have specified arsenic by USEPA Method SW6020 for the borehole VW31 and Warehouse Building step-out soil samples and arsenic and lead by USEPA Method SW6020 for the borehole VW35 step-out soil samples as these were the target metal analytes.

4.0 Investigation Results

This section presents the results of the current investigation conducted from June 2020 through March 2021.

4.1 Geology and Hydrogeology

Based on lithologic logging of boreholes VW14 through VW57, the Site soil consists of a heterogeneous combination of coarse-grained and fine-grained material throughout the areas and depths that were sampled consistent with previous boreholes advanced at the Site. The coarse-grained soil is predominantly comprised of poorly-graded sand and silty sand. The fine-grained soil is predominantly comprised of inorganic silts and clays and very fine sands. Neither bedrock nor groundwater was encountered in any of the boreholes, the deepest of which was advanced to 26.6 feet bgs. Appendix B contains the lithologic logs of the vapor well boreholes.

4.2 Analytical Results

4.2.1 Data Validation and Data Usability

Laboratory analytical data for the soil gas and soil samples collected during the current investigation were validated by the AECOM project chemist, except the November 2020 SVE quarterly soil gas monitoring analytical data and the analytical data for the soil samples collected from boreholes VW15 and VW38. The November 2020 SVE quarterly soil gas monitoring samples were not collected specifically for this investigation and were analyzed for a limited VOC analyte list; therefore, these data were not used in the VI pathway risk assessment and are considered supplemental to the March 2021 SVE quarterly soil gas monitoring analytical data, which were validated and include a full VOC analyte list. The analytical data associated with the unplanned soil samples collected from boreholes VW15 and VW38 were used for screening purposes and these locations were not the focus of the soil investigation.

The data validation results and data quality assessment are documented in the data validation summary contained within Appendix C. Laboratory analytical reports from BC Laboratories are contained within Appendix D. Validation is performed to ensure the quality of collected data and to assess limitation on usability, as well as to evaluate laboratory compliance with specified methods and protocols. The data are considered valid and usable for their intended purposes within the constraints of the final usability qualifiers assigned in data quality assessment. Data qualified with the “J” qualifier are considered estimated and usable with acceptable quantitative uncertainty. Data qualified with the “U” qualifier are considered non-detected. Non-detected results are reported at the laboratory MDL, except for blank-qualified data, which are reported at the measured value. Data qualified with the “R” qualifier are considered rejected and unusable.

For SVOCs by USEPA Method SW8270C, all sample results in two samples (VW-31-2 and VW-35-2) were rejected (“R” qualifier) because the calibration check compound (CCC) pentachlorophenol exceeded the relative standard deviation (RSD) of 30 percent (%) specified in the method. According to the method, “*high variability for these compounds may be indicative of system leaks or reactive sites on the column. If the RSD of any CCC is greater than 30%, then the chromatographic system is too reactive for analysis to begin.”* SVOCs were not previously identified as COCs in soil and SVOC analysis of soil samples was not included in the planned analytic approach for the current investigation; therefore, the rejected SVOC data is not considered essential in meeting the DQOs. Additionally, the soil samples associated with the rejected SVOC data are located in an area with arsenic-impacted soil that has been identified as requiring remedial action.

4.2.2 Soil Gas

In order to evaluate VI using subsurface data (e.g., soil gas), a vapor AF was applied to the ambient air (e.g., indoor air) SL to estimate a corresponding SVSL. Vapor attenuation refers to the reduction in VOC concentrations that

occurs during vapor migration in the subsurface, coupled with the dilution that can occur when the vapors enter a building and mix with indoor air (Johnson and Ettinger, 1991). The vapor AF represents the ratio between the indoor air concentration for a given VOC and its soil gas concentration. California VI guidance previously recommended using a default AF of 0.001 for existing commercial buildings with samples collected at the contamination source, along with the maximum soil gas concentration (DTSC, 2011). California draft VI guidance (CalEPA, 2020) currently recommends using the USEPA empirically-derived AF of 0.03 (USEPA, 2015) for preliminary screening of VOCs detected in soil gas. However, USEPA derived the 0.03 AF using VOC data primarily from single-family residences constructed with basements in states outside California with relatively cold climates. Basement construction and building heating are factors that can increase VI potential. Therefore, the 0.03 AF may overpredict VI for buildings without basements in warmer climates that are more typical in California and for larger commercial/industrial buildings with greater dilution potential when vapors entering the building mix with indoor air. Additionally, the 2020 California VI guidance recommending the use of the 0.03 AF has not been finalized. DTSC is conducting a VI AF study to derive a California-specific AF for VI calculations (DTSC, 2021), which when complete, will provide the redevelopment sector with an additional tool to facilitate the land revitalization process. Although the study is under peer review and the associated report has not been released to the public, the study investigators have presented preliminary findings at industry conferences (Bosan et al., 2020 and Abbasi et al. 2021). The preliminary findings suggest an AF closer to 0.001 than 0.03, which is consistent with other California-specific VI AF studies such as that performed by Ettinger et al. (2018), which resulted in an empirical AF of 0.002 for soil gas. Due to the uncertainties in which AF will ultimately be adopted for use in California, the following evaluation of the current investigation soil gas results used both the 0.03 AF and the 0.001 AF.

Tables 4-1 and 4-2 present the current investigation maximum analyte concentrations detected in soil gas compared to SVSLs. The SVSLs for all analytes except TPH_g were derived by dividing the DTSC HERO HHRA Note 3 residential and commercial/industrial ambient air SLs (DTSC 2020) by either the 0.03 AF (CalEPA, 2020) in Table 4-1 or the 0.001 AF (DTSC, 2011) in Table 4-2. TPH_g does not have established DTSC SLs; therefore, the TPH_g SVSLs were derived by dividing the San Francisco Bay Regional Water Quality Control Board residential and commercial/industrial indoor air ESLs (SWRCB, 2019) by either the 0.03 AF in Table 4-1 or the 0.001 AF in Table 4-2. Seventeen analytes (benzene, benzyl chloride, BDCM, chloroform, 1,2-DBE, 1,2-DCA, *cis*-1,2-DCE, 1,2-DCP, ethylbenzene, n-heptane, hexane, naphthalene, PCE, toluene, TCE, 1,2,3-trichloropropane [TCP], and TPH_g) were detected at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.03 AF. The highest benzene, benzyl chloride, BDCM, 1,2-DBE, 1,2-DCA, ethylbenzene, n-heptane, hexane, toluene, 1,2,3-TCP, and TPH_g concentrations were detected in soil gas samples collected at 14.5 feet. The highest chloroform, *cis*-1,2-DCE, 1,2-DCP, naphthalene, PCE, and TCE concentrations were detected in shallower soil gas samples collected from 5.5 feet or less. In comparison, only seven of these analytes (benzene, chloroform, 1,2-DBE, *cis*-1,2-DCE, PCE, TCE, and 1,2,3-TCP) were detected at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.001 AF.

The analytes detected in shallow soil gas (i.e., 5.5 feet or less) are of particular interest when evaluating the potential for VI to indoor air. Tables 4-3 and 4-4 present the current investigation analyte concentrations detected in shallow soil gas compared to residential and commercial/industrial SVSLs derived using the 0.03 and 0.001 AFs, respectively. Eleven analytes (benzene, BDCM, chloroform, 1,2-DBE, *cis*-1,2-DCE, 1,2-DCP, ethylbenzene, naphthalene, PCE, TCE, and TPH_g) were detected in shallow soil gas at concentrations exceeding commercial/industrial and/or residential SVSLs derived using the 0.03 AF. The frequency and magnitude of detection of these analytes is described below.

- **Benzene.** Benzene concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of benzene concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-1 and 4-2, respectively. For vapor wells sampled in December 2020 and March 2021, benzene concentrations detected during both sampling events are presented on

Figure 4-3. Benzene was detected in 37 of 57 shallow soil gas samples at a maximum concentration of 39 µg/m^3 (vapor well VW27A). The benzene concentrations detected in 23 of these samples exceeded the 3.2 µg/m^3 residential SVSL derived using the 0.03 AF, and the benzene concentrations detected in 8 of these samples also exceeded the corresponding 14 µg/m^3 commercial/industrial SVSL. In comparison, none of the benzene concentrations detected in shallow soil gas exceeded the 97 and 420 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.

- **BDCM.** BDCM concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of BDCM concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-4 and 4-5, respectively. For vapor wells sampled in December 2020 and March 2021, BDCM concentrations detected during both sampling events are presented on Figure 4-3. BDCM was detected in 2 of 57 shallow soil gas samples at concentrations of 12 and 24 µg/m^3. Both samples were associated with vapor well VW30A. The higher concentration was detected in a sample collected in March 2021, and the lower concentration was detected in a sample collected in December 2020. Both detected BDCM concentrations exceeded the 2.5 and 11 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.03 AF. In comparison, none of the BDCM concentrations detected in shallow soil gas exceeded the 76 and 330 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.
- **Chloroform.** Chloroform concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of chloroform concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-4 and 4-5, respectively. For vapor wells sampled in December 2020 and March 2021, chloroform concentrations detected during both sampling events are presented on Figure 4-3. Chloroform was detected in 27 of 57 shallow soil gas samples at a maximum concentration of 1,400 µg/m^3 (vapor well VW30A). The chloroform concentrations detected in 18 of these samples exceeded the 4.0 µg/m^3 residential SVSL derived using the 0.03 AF, and the chloroform concentrations detected in 4 of these samples also exceeded the corresponding 18 µg/m^3 commercial/industrial SVSL. In comparison, only two of the chloroform concentrations (650 and 1,400 µg/m^3) detected in shallow soil gas exceeded the 120 and 530 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF. Both samples were associated with vapor well VW30A. The higher concentration was detected in a sample collected in March 2021 and the lower concentration was detected in a sample collected in December 2020.
- **1,2-DBE.** 1,2-DBE concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of 1,2-DBE concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-4 and 4-5, respectively. For vapor wells sampled in December 2020 and March 2021, 1,2-DBE concentrations detected during both sampling events are presented on Figure 4-3. 1,2-DBE was detected in 3 of 57 shallow soil gas samples at a maximum concentration of 5.1 µg/m^3 (vapor well VW19A). The 1,2-DBE concentrations detected in all three of these samples exceeded the 0.16 and 0.67 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.03 AF. All samples for which 1,2-DBE was not detected had laboratory MDLs that were higher than the 0.67 µg/m^3 commercial/industrial SVSL. The lowest MDL achieved by the laboratory was 0.83 µg/m^3. In comparison, only one of the 1,2-DBE concentrations (5.1 µg/m^3) detected in shallow soil gas exceeded the 4.7 µg/m^3 residential SVSL derived using the 0.001 AF, and none of the 1,2-DBE concentrations detected in shallow soil gas exceeded the corresponding 20 µg/m^3 commercial/industrial SVSL. Of the samples for which 1,2-DBE was not detected, the laboratory MDLs for all but six samples were below the residential and commercial/industrial SVSLs derived using the 0.001 AF.
- ***cis*-1,2-DCE.** *cis*-1,2-DCE concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of *cis*-1,2-DCE concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-6 and 4-7, respectively. For vapor wells sampled in December 2020 and March 2021, *cis*-1,2-DCE concentrations detected during both sampling

events are presented on Figure 4-3. *cis*-1,2-DCE was detected in 2 of 57 shallow soil gas samples at concentrations of 35,000 and 47,000 µg/m^3. Both samples were associated with SVE system vapor well SVM-1. The higher concentration was detected in a sample collected in November 2020, and the lower concentration was detected in a sample collected in March 2021. *cis*-1,2-DCE is a PCE daughter product and its presence may be an indication that PCE degradation is occurring in the SVE treatment zone. Additionally, the decrease in *cis*-DCE concentrations from November 2020 to March 2021 may be attributable to SVE system operation. Both detected *cis*-1,2-DCE concentrations exceeded the 280 and 1,200 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.03 AF. In comparison, both *cis*-1,2-DCE concentrations detected in shallow soil gas exceeded the 8,300 µg/m^3 residential SVSL derived using the 0.001 AF, but only the higher concentration exceeded the corresponding 35,000 µg/m^3 commercial/industrial SVSL.

- **1,2-DCP.** 1,2-DCP was detected in 1 of 57 shallow soil gas samples at a concentration of 600 µg/m^3 (vapor well SVM-1). The detected 1,2-DCP concentration exceeded the 25 and 110 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.03 AF. In comparison, the 1,2-DCP concentration detected in shallow soil gas did not exceed the 760 and 3,300 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.
- **Ethylbenzene.** Ethylbenzene concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of ethylbenzene concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-1 and 4-2, respectively. For vapor wells sampled in December 2020 and March 2021, ethylbenzene concentrations detected during both sampling events are presented on Figure 4-3. Ethylbenzene was detected in 48 of 57 shallow soil gas samples at a maximum concentration of 66 µg/m^3 (vapor well VW16A). The ethylbenzene concentrations detected in six of these samples exceeded the 37 µg/m^3 residential SVSL derived using the 0.03 AF. None of the ethylbenzene concentrations detected in shallow soil gas exceeded the corresponding 14 µg/m^3 commercial/industrial SVSL. In comparison, none of the ethylbenzene concentrations detected in shallow soil gas exceeded the 1,100 and 4,900 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.
- **Naphthalene.** Naphthalene concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of naphthalene concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-1 and 4-2, respectively. For vapor wells sampled in December 2020 and March 2021, naphthalene concentrations detected during both sampling events are presented on Figure 4-3. Naphthalene was detected in 11 of 57 shallow soil gas samples at a maximum concentration of 70 µg/m^3 (vapor well VW48A). The naphthalene concentrations detected in all 11 of these samples exceeded the 2.8 µg/m^3 residential SVSL derived using the 0.03 AF, and the naphthalene concentrations detected in 2 of these samples also exceeded the corresponding 12 µg/m^3 commercial/industrial SVSL. In comparison, none of the naphthalene concentrations detected in shallow soil gas exceeded the 83 and 360 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.
- **PCE.** PCE concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of PCE concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-6 and 4-7, respectively. For vapor wells sampled in December 2020 and March 2021, PCE concentrations detected during both sampling events are presented on Figure 4-3. PCE was detected in 55 of 60 shallow soil gas samples at a maximum concentration of 1,200,000 µg/m^3 (vapor well SVM-1). The PCE concentrations detected in 42 of these samples exceeded the 15 µg/m^3 residential SVSL derived using the 0.03 AF, and the PCE concentrations detected in 20 of these samples also exceeded the corresponding 67 µg/m^3 commercial/industrial SVSL. In comparison, three of the PCE concentrations detected in shallow soil gas exceeded the 460 µg/m^3 residential SVSL derived using the 0.001 AF, and two of these PCE concentrations exceeded the corresponding 2,000 µg/m^3 commercial/industrial SVSL. Both

concentrations exceeding the 2,000 µg/m^3 commercial/industrial SVSL are associated with soil gas samples collected from SVE system vapor well SVM-1 in November 2020 (1,200,000 µg/m^3) and March 2021 (320,000 µg/m^3). The decrease in PCE concentrations at vapor well SVM-1 from November 2020 to March 2021 may be attributable to SVE system operation. Excluding vapor well SVM-1, the maximum PCE concentration detected in shallow soil gas was 650 µg/m^3 (vapor well VW24A).

- **TCE.** TCE concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of TCE concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-6 and 4-7, respectively. For vapor wells sampled in December 2020 and March 2021, TCE concentrations detected during both sampling events are presented on Figure 4-3. TCE was detected in 12 of 60 shallow soil gas samples at a maximum concentration of 16,000 µg/m^3 (vapor well SVM-1). The TCE concentrations detected in two of these samples exceeded the 16 and 100 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.03 AF, and the 480 and 3,000 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF. Both samples were associated with SVE system vapor well SVM-1. TCE is a PCE daughter product and its presence may be an indication that PCE degradation is occurring in the SVE treatment zone.
- **TPH_g.** TPH_g concentrations detected in soil gas samples collected in November and December 2020 and the lateral extent of TPH_g concentrations in shallow soil gas exceeding SVSLs derived using 0.03 and 0.001 AFs are presented on Figures 4-8 and 4-9, respectively. For vapor wells sampled in December 2020 and March 2021, TPH_g concentrations detected during both sampling events are presented on Figure 4-3. TPH_g was detected in 57 of 57 shallow soil gas samples at a maximum concentration of 500,000 µg/m^3 (vapor well SVM-1). The TPH_g concentrations detected in two of these samples exceeded the 20,000 µg/m^3 residential SVSL derived using the 0.03 AF, and the TPH_g concentrations detected in one of these samples also exceeded the corresponding 83,000 µg/m^3 commercial/industrial SVSL. In comparison, none of the TPH_g concentrations detected in shallow soil gas exceeded the 600,000 and 2,500,000 µg/m^3 residential and commercial/industrial SVSLs, respectively, derived using the 0.001 AF.

As discussed in Section 3.2.5, additional soil gas samples were collected from vapor wells VW24A, VW30A, VW30B, VW42A, VW45A, VW48A, VW49A, and VW57B in March 2021 to confirm the detected concentrations of certain VOCs exceeding their SVSLs in the soil gas samples initially collected from these wells in December 2020. The December 2020 and March 2021 analytical results for these wells and VOCs are presented on Figure 4-3 and summarized below.

- **Vapor well VW24A.** Chloroform was detected at a concentration of 9.3 µg/m^3 in the soil gas sample collected from vapor well VW24A in December 2020, which exceeded its 4.0 µg/m^3 residential SVSL derived using a 0.03 AF. Chloroform was not detected in the soil gas sample collected from this well in March 2021. Naphthalene was detected at a concentration of 9.8 µg/m^3 in the soil gas sample collected from vapor well VW24A in December 2020, which exceeded its 2.8 µg/m^3 residential SVSL derived using a 0.03 AF. Naphthalene was detected at concentrations of 6.9 and 17 µg/m^3 in duplicate soil gas samples collected from this well in March 2021. The higher naphthalene concentration from March 2021 exceeded its 12 µg/m^3 commercial/industrial SVSL derived using a 0.03 AF. PCE was detected at a concentration of 650 µg/m^3 in the soil gas sample collected from vapor well VW24A in December 2020, which exceeded its 67 µg/m^3 commercial/industrial SVSL derived using a 0.03 AF and its 460 µg/m^3 residential SVSL derived using a 0.001 AF. PCE was detected at concentrations of 110 and 120 µg/m^3 in duplicate soil gas samples collected from this well in March 2021, which exceeded its 67 µg/m^3 commercial/industrial SVSL derived using a 0.03 AF.
- **Vapor well VW30A.** Benzene and naphthalene were detected at concentrations of 3.7 and 7.5 µg/m^3, respectively, in the soil gas sample collected from vapor well VW30A in December 2020, which exceeded their respective 3.2 and 2.8 µg/m^3 residential SVSLs derived using a 0.03 AF. Benzene and naphthalene were not detected in the soil gas sample collected from this well in March 2021. BDCM was detected at

concentrations of 12 and 24 µg/m^3 in the soil gas samples collected from vapor well VW30A in December 2020 and March 2021, respectively. Both concentrations exceed the 11 µg/m^3 commercial/industrial BDCM SVSL derived using a 0.03 AF. Chloroform was detected at concentrations of 650 and 1,400 µg/m^3 in the soil gas samples collected from vapor well VW30A in December 2020 and March 2021, respectively. Both concentrations exceed the 18 and 530 µg/m^3 commercial/industrial chloroform SVSLs derived using 0.03 and 0.001 AFs, respectively. PCE was detected at concentrations of 99 and 210 µg/m^3 in the soil gas samples collected from vapor well VW30A in December 2020 and March 2021, respectively. Both concentrations exceed the 67 µg/m^3 commercial/industrial PCE SVSL derived using a 0.03 AF.

- **Vapor well VW30B.** BDCM was detected at concentrations of 60 and 43 µg/m^3 in the soil gas samples collected from vapor well VW30B in December 2020 and March 2021, respectively. Both concentrations exceed 11 µg/m^3 commercial/industrial BDCM SVSL derived using a 0.03 AF. Chloroform was detected at concentrations of 1,300 and 920 µg/m^3 in the soil gas samples collected from vapor well VW30B in December 2020 and March 2021, respectively. Both concentrations exceed the 18 and 530 µg/m^3 commercial/industrial chloroform SVSLs derived using 0.03 and 0.001 AFs, respectively. PCE was detected at concentrations of 370 and 290 µg/m^3 in the soil gas samples collected from vapor well VW30B in December 2020 and March 2021, respectively. Both concentrations exceed the 67 µg/m^3 commercial/industrial PCE SVSL derived using a 0.03 AF.
- **Vapor well VW42A.** TPH_g was detected at a concentration of 63,000 µg/m^3 in the soil gas sample collected from vapor well VW42A in December 2020 exceeding its 20,000 µg/m^3 residential SVSL derived using a 0.03 AF. The TPH_g concentration detected in the soil gas sample collected from this well in March 2021 was 91 µg/m^3, which is below its SVSLs derived using 0.03 and 0.001 AFs.
- **Vapor well VW45A.** Benzene was detected at a concentration of 17 µg/m^3 in the soil gas sample collected from vapor well VW45A in December 2020, which exceeds its 14 µg/m^3 commercial/industrial SVSL derived using a 0.03 AF. Benzene was not detected in the soil gas sample collected from this well in March 2021. 1,2-DBE, which was not detected in the December 2020 soil gas sample collected from vapor well VW45A, was detected at a concentration of 4.0 µg/m^3 in the March 2021 soil gas sample collected from this well, exceeding its 0.67 µg/m^3 commercial/industrial SVSL derived using a 0.03 AF.
- **Vapor well VW48A.** PCE was detected at concentrations of 35 and 29 µg/m^3 in the soil gas samples collected from vapor well VW48A in December 2020 and March 2021, respectively. Both concentrations exceed the 15 µg/m^3 residential PCE SVSL derived using a 0.03 AF. Chloroform was detected at concentrations of 3.5 and 5.4 µg/m^3 in the soil gas samples collected from vapor well VW48A in December 2020 and March 2021, respectively. The chloroform concentration detected in December 2020 did not exceed SVSLs, while the chloroform concentration detected in March 2021 exceeds the 4.0 µg/m^3 residential SVSL derived using a 0.03 AF. 1,2-DBE and naphthalene, which were not detected in the December 2020 soil gas sample collected from vapor well VW48A, were detected at concentrations of 2.8 and 70 µg/m^3, respectively, in the March 2021 soil gas sample collected from this well, exceeding their respective 0.67 and 12 µg/m^3 commercial/industrial SVSLs derived using a 0.03 AF.
- **Vapor well VW49A.** Chloroform was detected at concentrations of 4.7 and 7.6 µg/m^3 in the soil gas samples collected from vapor well VW49A in December 2020 and March 2021, respectively. Both concentrations exceed the 4.0 µg/m^3 residential chloroform SVSL derived using a 0.03 AF. PCE was detected at concentrations of 54 and 55 µg/m^3 in the soil gas samples collected from vapor well VW49A in December 2020 and March 2021, respectively. Both concentrations exceed the 15 µg/m^3 residential SVSL derived using a 0.03 AF.
- **Vapor well VW57B.** In December 2020, benzene was detected at concentrations of 2,100 and 2,500 µg/m^3 and ethylbenzene was detected at concentrations of 180 and 220 µg/m^3 in duplicate soil gas samples collected from vapor well VW57B, exceeding their respective commercial/industrial SVSLs derived using a 0.03 AF. In December 2020, n-heptane was detected at concentrations of 13,000 and 16,000 µg/m^3, hexane was detected at concentrations of 64,000 and 76,000 µg/m^3, and toluene was detected at

concentrations of 8,200 and 11,000 µg/m^3 in duplicate soil gas samples collected from vapor well VW57B. One or both detected concentrations of n-heptane, hexane, and toluene exceeded their respective residential SVSLs derived using a 0.03 AF. Benzene, ethylbenzene, n-heptane, hexane, and toluene were not detected in the soil gas samples collected from vapor well VW57B in March 2021. In December 2020, TPH_g was detected at concentrations of 1,500,000 and 1,900,000 µg/m^3 in duplicate soil gas samples collected from vapor well VW57B, exceeding its commercial/industrial SVSLs derived using a 0.03 AF and its residential SVSL derived using a 0.001 AF. The TPH_g concentration detected in the soil gas sample collected from this well in March 2021 was 100 µg/m^3, which is below the TPH_g SVSLs derived using 0.03 and 0.001 AFs.

4.2.3 Soil

Analytical results for arsenic in soil are presented in Table 4-5. Arsenic concentrations detected in soil during the current and previous investigations are presented on Figure 4-10. Arsenic concentrations detected in soil during the current investigation ranged from 3.4 to 280 mg/kg with the maximum concentration detected in the sample collected from 2 feet bgs at borehole VW35-S. The highest arsenic concentrations detected during the current investigation were associated with borehole locations at the western portion of the Site to the west and northwest of the Salvage Building.

Borehole B08 Step-Outs. In June 2020, four step-out boreholes were advanced to the north (B08-N), east (B08-E), south (B08-S), and west (B08-W) of previous investigation borehole B08. Soil samples were collected from each step-out borehole at depths of 1.5 and 3 feet bgs. Arsenic concentrations detected in these soil samples ranged from 5.7 to 54 mg/kg. All detected arsenic concentrations exceeded the 17.53 mg/kg Site-specific arsenic background concentration, except for the concentrations detected in the soil samples collected from 3 feet bgs at boreholes B08-N, B08-S, and B08-W.

In July 2020, three additional step-out boreholes were advanced to the north (B08-NN), east (B08-EE), and south (B08-SS). Soil samples were collected from each step-out borehole at a depth of 1.5 feet bgs. An additional soil sample was collected at a depth of 3 feet bgs from borehole B08-EE. Arsenic concentrations detected in these soil samples ranged from 13 to 99 mg/kg. The arsenic concentrations detected in the soil samples collected from 1.5 feet bgs exceeded the 17.53 mg/kg background concentration.

In August 2020, three additional step-out boreholes were advanced to the north (B08-3-N), east (B08-3-E), and south (B08-3-S). Soil samples were collected from each step-out borehole at a depth of 1.5 feet bgs. Arsenic concentrations detected in these soil samples ranged from 39 to 48 mg/kg. The arsenic concentrations detected in the soil samples collected from boreholes B08-3-N and B08-3-W exceeded the 17.53 mg/kg background concentration. No additional step-out boreholes were advanced.

Borehole KA-10 Step-Outs. In June 2020, three step-out boreholes were advanced to the north (KA-10-N), south (KA-10-S), and west (KA-10-W) of Phase II ESA borehole KA-10. A step-out borehole was not advanced to the east due to the presence of the Hazardous Material Building. Soil samples were collected from each step-out borehole at depths of 1.5 and 3 feet bgs. Arsenic concentrations detected in these soil samples ranged from 3.9 to 110 mg/kg. The arsenic concentrations of 110 and 35 mg/kg detected in the soil samples collected from 1.5 feet bgs at boreholes KA-10-S and KA-10-W, respectively, exceeded the 17.53 mg/kg Site-specific arsenic background concentration.

In July 2020, three additional step-out boreholes were advanced to the south (KA-10-SS), southwest (KA-10-SW), and west (KA-10-WW). Soil samples were collected from each step-out borehole at a depth of 1.5 feet bgs. Arsenic concentrations detected in these soil samples ranged from 11 to 38 mg/kg. The arsenic concentrations of 38 and 21 mg/kg detected in the soil samples collected from boreholes KA-10-SS and KA-10-SW, respectively, exceeded the 17.53 mg/kg background concentration.

In August 2020, one additional step-out borehole was advanced to the south (KA-10-3-S) and a soil sample was collected from a depth of 1.5 feet bgs. Arsenic was detected at a concentration of 16 mg/kg, which did not exceed the 17.53 mg/kg background concentration.

Borehole KA-17 Step-Outs. In June 2020, three step-out boreholes were advanced to the north (KA-17-N), east (KA-17-E), and west (KA-17-W) of Phase II ESA borehole KA-17. A step-out borehole was not advanced to the south because previous investigation borehole B09 defines the lateral extent of arsenic in soil to the south. Soil samples were collected from each step-out borehole at depths of 1.5 and 3 feet bgs. Arsenic concentrations detected in these soil samples ranged from 3.6 to 150 mg/kg. The arsenic concentrations of 78 and 150 mg/kg detected in the soil samples collected from 1.5 feet bgs at boreholes KA-17-N and KA-17-W, respectively, exceeded the 17.53 mg/kg Site-specific arsenic background concentration.

In July 2020, three additional step-out boreholes were advanced to the north (KA-17-NN), northwest (KA-17-NW), and west (KA-17-WW). Soil samples were collected from each step-out borehole at a depth of 1.5 feet bgs. Arsenic concentrations detected in these soil samples ranged from 37 to 59 mg/kg, which exceeded the 17.53 mg/kg background concentration.

In August 2020, four additional step-out boreholes were advanced to the north (KA-17-3-N), northeast, (KA-17-3-NE), northwest (KA-17-3-NW), and west (KA-17-3-W). Soil samples were collected from each step-out borehole at a depth of 1.5 feet bgs. Arsenic concentrations detected in these soil samples ranged from 3.4 to 140 mg/kg. The arsenic concentrations of 60 and 140 mg/kg detected in the soil samples collected from boreholes KA-17-3-W and KA-17-3-NE, respectively, exceeded the 17.53 mg/kg background concentration. One additional step-out borehole was advanced to the northeast (KA-17-4-NE), and a soil sample was collected from a depth of 1.5 feet bgs. Arsenic was detected at a concentration of 14 mg/kg, which did not exceed the 17.53 mg/kg background concentration.

Borehole KA-44 Step-Outs. In June 2020, four step-out boreholes were advanced to the north (KA-44-N), east (KA-44-E), south (KA-44-S), and west (KA-44-W) of Phase II ESA borehole KA-44. Soil samples were collected from each step-out borehole at depths of 1.5 and 3 feet bgs. Arsenic concentrations detected in these soil samples ranged from 4.4 to 14 mg/kg, which were below the 17.53 mg/kg Site-specific arsenic background concentration.

Warehouse Building Step-Outs. In December 2020, two vapor well boreholes (VW56 and VW57) and seven step-out boreholes (WB01 through WB07) were advanced to the south and southeast of the Warehouse Building. During advancement of vapor well boreholes VW56 and VW57, soil samples were collected at a depth of 1.5 feet bgs. Boreholes WB01 and WB02 were advanced at the southern loading dock. Soil samples were collected from non-native fill material 1.5 feet below the loading dock platform ("Dock" samples) and from a depth equivalent to 0.5 foot below the surrounding grade. An additional soil sample was collected from 1.5 feet below the surrounding grade at borehole WB01. Boreholes WB03 and WB04 were advanced at the parking stalls adjacent to the loading dock where soil samples were collected from a depth of 1.5 feet bgs. Boreholes WB05 through WB07 were advanced along both sides of the driveway exiting the Site where soil samples were collected at depths of 1.5 and 5 feet bgs. Arsenic concentrations detected in the soil samples collected from boreholes VW56, WB01 (0.5 foot and 1.5 feet bgs), WB02 through WB05, WB06 (1.5 feet bgs), and WB07 (1.5 feet bgs) ranged from 3.7 to 12 mg/kg, which were below the 17.53 mg/kg Site-specific arsenic background concentration. Arsenic was detected in the soil samples collected from boreholes VW57, WB01 ("Dock"), WB06 (5 feet bgs), and WB07 (5 feet bgs) at concentrations ranging from 30 to 170 mg/kg, which exceeded the 17.53 mg/kg background concentration.

In February 2021, five additional step-out boreholes (WB08 through WB12) were advanced to the south and southeast of the Warehouse Building. Boreholes WB08 and WB09 were advanced at the southern loading dock to the west and east of boreholes WB01 and WB02, respectively. Soil samples were collected from non-native fill

material 1.5 feet below the loading dock platform (“Dock” samples) and from a depth equivalent to 1.5 feet below the surrounding grade. Borehole WB10 was advanced at the location of previous investigation borehole B17, where arsenic was detected at a concentration of 330 mg/kg in the soil sample collected from 5 feet bgs. Soil samples were collected from borehole WB10 at depths of 7.5 and 10 feet bgs to further delineate the vertical extent of arsenic. Boreholes WB11 and WB12 were advanced to the north of borehole WB06 and east of borehole WB07, respectively, where soil samples were collected from depths of 1.5 and 5 feet bgs. Arsenic concentrations detected in the soil samples collected from boreholes WB08, WB09, WB11, and WB12 ranged from 3.1 to 15 mg/kg, which were below the 17.53 mg/kg background concentration. Arsenic was detected in the 7.5 and 10-foot bgs soil samples collected from borehole WB10 at concentrations of 65 and 55 mg/kg, respectively, which exceeded the 17.53 mg/kg background concentration.

Vapor Well Boreholes and Step-Outs. Analytical results for soil samples collected from vapor well boreholes VW15, VW31, VW35, and VW38 and borehole VW35 and VW38 step-out locations are presented in Table 4-6. Concentrations of the analytes detected in soil at these locations are presented on Figure 4-11.

- **Borehole VW15.** During advancement of borehole VW15 in December 2020, the field geologist observed dark, possibly stained soil from 2 to 2.5 feet bgs. The soil had an organic odor. PID readings taken from the soil indicated VOC concentrations ranging from 73 to 76 ppb. A soil sample was collected from 2 feet bgs and analyzed for VOCs, SVOCs, PCBs, TPH, and metals (including mercury). VOCs and SVOCs were not detected. Aroclor 1260 was detected at a concentration of 0.010 mg/kg, which was below the 0.24 mg/kg residential SL. TPH_d and $TPH_{ho/mo}$ were detected at concentrations of 40 and 510 mg/kg, respectively, which are below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). All detected metals concentrations were below their respective SLs, except arsenic. Arsenic was detected at a concentration of 7.3 mg/kg, which exceeded its 0.11 and 0.36 mg/kg residential and commercial/industrial SLs, respectively, but did not exceed its 17.53 mg/kg background concentration. The analytical results did not indicate significant contamination; therefore, further soil investigation was not performed at this location.
- **Borehole VW31.** During advancement of borehole VW31 in November 2020, the field geologist observed stained soil from 2 to 2.5 feet bgs. The soil had a slight petroleum odor. A soil sample was collected from 2 feet bgs and analyzed for VOCs, SVOCs, PCBs, TPH, and metals (including mercury). VOCs and SVOCs were not detected. Aroclor 1260 was detected at a concentration of 0.0077 mg/kg, which was below the 0.24 mg/kg residential SL. TPH_d and $TPH_{ho/mo}$ were detected at concentrations of 7.7 and 29 mg/kg, respectively, which are below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). All detected metals concentrations were below their respective SLs, except arsenic. Arsenic was detected at a concentration of 26 mg/kg, which exceeded its 0.11 and 0.36 mg/kg residential and commercial/industrial SLs, respectively, and its 17.53 mg/kg background concentration. The analytical results indicated arsenic contamination in soil; therefore, further soil investigation to approximate the extent of arsenic-impacted soil was performed.
- **Borehole VW31 Step-Outs.** The lateral extent of arsenic to the west, east, and northwest of borehole VW31 is defined by arsenic data associated with previous investigation boreholes B04 and B05 and current investigation borehole KA-10-3-S. In February 2021, step-out borehole VW31-S was advanced approximately 15 feet to the south of borehole VW31 in an attempt to define the southern extent of arsenic impacted soil. Soil samples were collected at depths of 2 and 5 feet bgs from borehole VW31-S. Arsenic was detected at a concentration of 150 mg/kg in the soil sample from 2 feet bgs, exceeding the 17.53 mg/kg background concentration. Arsenic was detected at a concentration of 6.0 mg/kg in duplicate soil samples from 5 feet bgs, which is less than the 17.53 mg/kg background concentration. Borehole VW35-NN, which was advanced as a northern step-out for borehole VW35-N also served as a southern step-out from borehole VW31-S. Soil samples were collected at depths of 2 and 5 feet bgs from borehole VW35-NN. Arsenic was detected at a concentration of 100 mg/kg in the soil sample from 2 feet bgs, exceeding the 17.53 mg/kg background concentration. Arsenic was detected at a concentration of 4.4 mg/kg in the soil

sample from 5 feet bgs, which is less than the 17.53 mg/kg background concentration. The southern step-out sampling results indicate arsenic-impacted soil extends to the vicinity of borehole VW35, which is discussed in the following bullet.

- **Borehole VW35.** During advancement of borehole VW35 in November 2020, the field geologist observed dark brown to black stained soil from 0 to 3.5 feet bgs. The soil did not have an odor, but a slight greasy sheen was observed. PID readings taken from the soil indicated VOC concentrations ranging from 826 to 1,669 ppb. A soil sample was collected from 2 feet bgs and analyzed for VOCs, SVOCs, PCBs, TPH, and metals (including mercury). PCE was detected at a concentration of 0.0017 mg/kg, which was below its 0.59 mg/kg residential SL. No other VOCs were detected, and no SVOCs were detected. Aroclor 1260 was detected at a concentration of 0.035 mg/kg, which was below the 0.24 mg/kg residential SL. TPH_d and $TPH_{ho/mo}$ were detected at concentrations of 650 and 3,500 mg/kg, respectively. The detected TPH_d concentration was below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). The detected $TPH_{ho/mo}$ concentration exceeded the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High), but was below the corresponding 18,000 mg/kg commercial/industrial SL. All detected metal concentrations were below their respective SLs, except arsenic and lead. Arsenic was detected at a concentration of 46 mg/kg, which exceeded its 0.11 and 0.36 mg/kg residential and commercial/industrial SLs, respectively, and its 17.53 mg/kg background concentration. Lead was detected at a concentration of 120 mg/kg, which exceeded its 80 mg/kg residential SL, but not its 320 mg/kg commercial/industrial SL. The analytical results indicated $TPH_{ho/mo}$, arsenic, and lead contamination in soil; therefore, further soil investigation to approximate the extent of contamination was performed.
- **Borehole VW35 Step-Outs.** In February 2021, an initial set of step-out boreholes were advanced approximately 15 feet to the north (VW35-N), east (VW35-E), south (VW35-S), and west (VW35-W) of borehole VW35. Soil samples were collected at depths of 2 and 5 feet bgs. An additional soil sample was collected from borehole VW35-N at a depth of 7.5 feet based on XRF field measurements indicating elevated arsenic concentrations extended beyond 5 feet bgs. The soil samples were analyzed for TPH, arsenic, and lead. TPH_d was either not detected or detected at concentrations below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). $TPH_{ho/mo}$ was detected at concentrations below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High), except for the 6,000 mg/kg concentration detected in the soil sample collected from 2 feet bgs at borehole VW35-N. Arsenic was detected at concentrations exceeding the 17.53 mg/kg background concentrations in all samples except the deepest sample (either 5 or 7.5 feet bgs) collected from each borehole. Lead was detected at concentrations below the 80 mg/kg residential SL, except for the 130 mg/kg concentration detected in the soil sample collected from 2 feet bgs at borehole VW35-N. Additional step-out boreholes were advanced to the north (VW35-NN) and south (VW35-SS). Soil samples were collected at depths of 2 and 5 feet bgs and analyzed for TPH, arsenic, and lead. TPH_d was not detected. $TPH_{ho/mo}$ was either not detected or detected at concentrations below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). Arsenic was detected at concentrations below the 17.53 mg/kg background concentration, except for the 100 mg/kg concentration detected in the soil sample collected from borehole VW35-NN at 2 feet bgs. The northern step-out sampling results indicate arsenic-impacted soil extends to the vicinity of borehole VW31, which was previously discussed. Lead was detected at concentrations below the 80 mg/kg residential SL.
- **Borehole VW38.** During advancement of borehole VW38 in November 2020, the field geologist observed discolored soil from 1.5 to 3 feet bgs. PID readings taken from the soil indicated VOC concentrations ranging from 890 to 1,300 ppb. A soil sample was collected from 2 feet bgs and analyzed for VOCs, SVOCs, PCBs, TPH, and metals (including mercury). VOCs and SVOCs were not detected. Aroclor 1260 was detected at a concentration of 0.0023 mg/kg, which was below the 0.24 mg/kg residential SL. TPH_d and $TPH_{ho/mo}$ were detected at concentrations of 10 and 36 mg/kg, respectively, which are below the 2,800 mg/kg residential SL for TPH (C17-C32 Aromatic High). All detected metals concentrations were below their respective SLs, except arsenic. Arsenic was detected at a concentration of 17 mg/kg, which

exceeded its 0.11 and 0.36 mg/kg residential and commercial/industrial SLs, respectively, but did not exceed its 17.53 mg/kg background concentration. The analytical results did not indicate significant contamination; therefore, further soil investigation was not performed at this location.

5.0 Human Health Risk Assessment for the Vapor Intrusion Pathway

A focused baseline HHRA was performed for the VI exposure pathway. The HHRA results are presented in Appendix E and summarized in this section. The Site is currently used for limited commercial and industrial purposes as most activities formerly conducted at the Site have either been transferred to other SMUD facilities or are no longer conducted by SMUD. Following remedial action for VOCs in soil gas and arsenic soil, SMUD's planned Site redevelopment includes a mix of residential and commercial/industrial uses.

For current commercial/industrial workers, the inhalation of vapors in indoor air is considered a complete pathway. To address potential risk to current commercial/industrial workers, SMUD previously conducted indoor air sampling within the Tool Issue Building in December 2016 and April 2019 (AECOM, 2019). The Tool Issue Building was selected for indoor air sampling because it represented the worst-case scenario in terms of the building's proximity to the highest VOC concentrations detected in soil gas at the Site. Based on the indoor air sampling results, it was concluded that VI was not an immediate concern. Therefore, additional indoor air sampling was not performed as part of the current investigation, and indoor air risk for current receptors was not addressed in the HHRA.

Inhalation of vapors in indoor air is considered a potentially complete pathway for potential future residents and commercial/industrial workers. Future redevelopment of the Site may expose construction workers to VOCs migrating from the subsurface to outdoor air while working in an excavation trench. No well-established models are available for estimating the migration of volatiles into an excavation trench. Exposure to volatiles is expected to be *de minimus* due to mixing with outdoor air. Thus, this potentially complete, yet insignificant, exposure pathway was not quantitatively evaluated in the HHRA.

Soil vapor data collected in November and December 2020 from 5.5 feet bgs at 42 vapor monitoring wells (VW16A through VW57A) and March 2021 from 5.5 feet bgs at six vapor monitoring wells (VW24A, VW30A, VW42A, VW45A, VW48A, VW49A) and from 4.0 or 5.0 feet bgs at three SVE system vapor monitoring wells (SVM-1 through SVM-3) were used to evaluate soil vapor risk for potential future residents and commercial/industrial workers (Appendix E, Table 1). When more than one result was available for a particular sample location, the highest detected analyte concentration was used in the risk evaluation for that location. Chemicals of potential concern (COPCs) are the contaminants suspected of being site-related and are the analytes carried through the HHRA's quantitative risk calculations. A chemical was identified as a COPC if its maximum detected concentration exceeded its SVSL (Appendix E, Tables 2a and 2b). Additionally, chemicals detected at concentrations below their respective SVSLs were conservatively carried through the HHRA's quantitative risk calculations (Appendix E, Tables 2a and 2b).

The risk characterization is the presentation of the quantitative risk results with supporting definitions, context, and site applicability. Per USEPA (1991), an excess lifetime cancer risk (ELCR) of $1x10^{-6}$ or less is considered *de minimis* risk. A noncancer hazard index (HI) of less than 1 is also acceptable because the concentrations are cumulatively below harmful levels. USEPA (1991) uses the ELCR range of 10^{-4} to 10^{-6} as a "target risk management range." Risks in this range may be acceptable for risk management decisions. Consistent with the screening-level evaluation described in Section 4.2.2, two AFs (0.03 and 0.001) were utilized in the HHRA for the VI pathway.

5.1 Cumulative Risk and Hazard Evaluation

Table 5-1 provides a summary of the cumulative VI pathway risk and hazard results. The risk characterization for residential, commercial/industrial, and construction worker receptors using SVSLs derived from AFs of 0.03 and 0.001 is summarized below.

- Using an AF of 0.03, the future resident ELCR from exposure to soil vapor is $2x10^{-2}$, which is greater than the risk management range. The primary cancer risk driver is PCE ($2.1x10^{-2}$), with decreasing contributions from TCE ($9.4x10^{-4}$), chloroform ($3.4x10^{-4}$), 1,2-DBE ($3.3x10^{-5}$), naphthalene ($2.5x10^{-5}$), 1,2-DCP ($2.4x10^{-5}$), benzene ($1x10^{-5}$), BDCM ($9.5x10^{-6}$), and ethylbenzene ($1.8x10^{-6}$). The noncancer HI for soil vapor exposure is 578, which is greater than the safe dose threshold of 1. The primary hazard driver is PCE (229), with decreasing contributions from TCE (215), *cis*-1,2-DCE (127), 1,2-DCP (4.3), and toluene (0.92).
- Using an AF of 0.001, the future resident ELCR from exposure to soil vapor is $7x10^{-4}$, which is greater than the risk management range. The primary cancer risk driver is PCE ($7.0x10^{-4}$), with decreasing contributions from TCE ($3.1x10^{-5}$), chloroform ($1.1x10^{-5}$), and 1,2-DBE ($1x10^{-6}$). The noncancer HI for soil vapor exposure is 19, which is greater than the safe dose threshold of 1. The primary hazard driver is PCE (7.6), with decreasing contributions from TCE (7.2), and *cis*-1,2-DCE (4.2).
- Using an AF of 0.03, the future commercial/industrial worker ELCR from exposure to soil vapor is $5x10^{-3}$, which is greater than the risk management range. The primary cancer risk driver is PCE ($4.8x10^{-3}$), with decreasing contributions from TCE ($1.5x10^{-4}$), chloroform ($7.8x10^{-5}$), 1,2-DBE ($7.6x10^{-6}$), naphthalene ($5.8x10^{-6}$), 1,2-DCP ($5.5x10^{-6}$), benzene ($2.8x10^{-6}$), and BDCM ($2.2x10^{-6}$). The noncancer HI for soil vapor exposure is 136, which is greater than the safe dose threshold of 1. The primary hazard driver is PCE (53.3), with decreasing contributions from TCE (51.7), *cis*-1,2-DCE (29.2), and 1,2-DCP (1.0).
- Using an AF of 0.001, the future commercial/industrial worker ELCR from exposure to soil vapor is $2x10^{-4}$, which is within the risk management range. The primary cancer risk driver is chloroform, with decreasing contributions from PCE and 1,2-DBE. The noncancer HI for soil vapor exposure is 5, which is greater than the safe dose threshold of 1. The primary hazard driver is PCE (1.8), with decreasing contributions from TCE (1.7), and *cis*-1,2-DCE (1.0).

COCs are contaminants that pose unacceptable risk. Based on the HHRA, the soil gas COCs are listed below by receptor and the applicable AF.

- Future resident soil vapor exposure scenario (0.03 AF) – benzene, BDCM, chloroform, 1,2-DBE, *cis*-1,2-DCE, ethylbenzene, naphthalene, PCE, toluene, and TCE.
- Future resident soil vapor exposure scenario (0.001 AF) – chloroform, 1,2-DBE, *cis*-1,2-DCE, PCE, and TCE.
- The future commercial/industrial worker soil vapor exposure scenario (0.03 AF) – benzene, BDCM, chloroform, 1,2-DBE, *cis*-1,2-DCE, 1,2-DCP, naphthalene, PCE, and TCE.
- The future commercial/industrial worker soil vapor exposure scenario (0.001 AF) – chloroform, PCE, and TCE.

5.2 Point Risk and Hazard Evaluation

In order to limit uncertainty associated with such a large site, point risk estimates were developed for the future resident and commercial/industrial worker scenarios using the 0.03 and 0.001 AFs to evaluate if portions of the Site exhibit unacceptable risks and/or hazards.

To calculate the cumulative ELCR and HI for each receptor, the individual chemical risks and hazards were summed at each sample location. Non-detect results were not included in point risk estimates. Details of the point risk estimates are presented in Appendix E, Tables E-5A through E-5D. The magnitude of estimated risk at each sampling location is presented on Figure 5-1 (Resident Scenario, 0.03 AF), Figure 5-2 (Resident Scenario, 0.001 AF), Figure 5-3 (Commercial/Industrial Worker Scenario, 0.03 AF), and Figure 5-4 (Commercial/Industrial Worker Scenario, 0.001 AF).

For the future resident scenario based on a 0.03 AF, potentially unacceptable risks and/or hazards were calculated for the majority of sample locations distributed across the Site. The majority of unacceptable risks and hazards were driven by the presence of benzene, chloroform, 1,2-DBE, PCE, TCE, toluene, and naphthalene. Acceptable risks were limited to locations VW37, VW42, VW43, VW46, VW47, and SVM-2. In comparison, based on a 0.001 AF, potentially unacceptable risks and/or hazards were limited to locations VW19 (cancer risk), VW24 (cancer risk), VW30 (cancer risk), VW48 (cancer risk), and SVM-1 (cancer risk and noncancer hazard),which were driven by the presence of PCE, TCE, and chloroform.

For the future commercial/industrial worker scenario based on a 0.03 AF, potentially unacceptable risks and/or hazards were calculated for locations in the northern portion of the North Corporation Yard (VW16 through VW19, VW21 through VW27, VW29, VW30, VW44, VW45, VW52, and VW54. In the southern portion of the North Corporation Yard, potentially unacceptable risks and/or hazards were limited to VW34 through VW36, VW48, and SVM-1. Potentially unacceptable risks and hazards were driven by the presence of benzene, chloroform, 1,2-DBE, PCE, TCE, and naphthalene. In comparison, potentially unacceptable risks and/or hazards based on a 0.001 AF were calculated for two only locations (SVM-1 and VW30). Potentially unacceptable risks and hazards were driven by the presence of chloroform, PCE, and TCE.

6.0 Summary and Conclusions

6.1 Chemicals of Concern

6.1.1 Soil Gas

PCE in soil gas was previously identified as a COC at the Site because of the potential for unacceptable human health risk if soil gas migrated into indoor air (i.e., the VI pathway). This conclusion was based on a 0.001 soil vapor AF. After evaluating the results of the current investigation, 1,2-DBE, *cis*-1,2-DCE, chloroform, and TCE were identified as additional COCs in soil gas based on a 0.001 AF. When a more conservative 0.03 AF was applied, benzene, BDCM, ethylbenzene, naphthalene, and toluene were also identified as COCs in soil gas.

6.1.2 Soil

Arsenic in soil was previously identified as a COC at the Site because it is present in soil at concentrations exceeding its 0.11 and 0.36 mg/kg residential and commercial/industrial SLs, respectively, and the 17.53 mg/kg Site-specific background concentration. Although the primary focus of the current soil investigation was to further refine the lateral and vertical extent of arsenic-impacted soil to support remedy selection and design, evidence of suspected soil contamination was identified during advancement of vapor well boreholes VW15, VW31, VW35, and VW38. The laboratory analytical results for the soil samples collected from these boreholes, indicated arsenic-impacted soil was present in the vicinity of boreholes VW31 and VW35. Furthermore, lead and $TPH_{ho/mo}$ were identified as additional COCs in soil in the vicinity of borehole VW35. No significant contamination was identified in the soil samples collected from boreholes VW15 and VW38.

6.2 Extent of Contamination

6.2.1 Soil Gas

The lateral extent of VOC concentrations in soil gas exceeding their respective residential and commercial/industrial SVSLs based on shallow soil gas data (i.e., from 4 to 5.5 feet bgs) is shown on Figures 4-1, 4-2, and 4-4 through 4-8. The lateral extent of VOC concentrations in soil gas exceeding the SVSLs derived using a 0.03 AF extends beneath approximately 9.2 acres in the western two-thirds of the North Corporation Yard and may extend beyond the property boundary to the north, west and south. In comparison, the lateral extent of VOC concentrations in soil gas exceeding the SVSLs derived using a 0.001 AF is limited to two localized areas: in the vicinity of vapor wells SVM-1 and VW14 at the north side of the Tool Issue Building and an area encompassing vapor wells VW19, VW24, and VW30, including the area beneath the western portion of the Garage Building. These two areas comprise approximately 0.65 acre.

The maximum concentration of five soil gas COCs (chloroform, naphthalene, PCE, TCE, and *cis*-1,2-DCE) were detected in shallow soil gas samples collected from 4 to 5.5 feet bgs. The maximum concentration of five soil gas COCs (benzene, ethylbenzene, toluene, BDCM, and 1,2-DBE) were detected in samples collected from 14.5 feet bgs. The vertical extent of these COCs beyond 14.5 feet bgs is not known, except at vapor wells VW14 and VW15, which were installed to depths of 25.5 and 23.5 feet bgs, respectively. Six soil gas COCs (chloroform, ethylbenzene, toluene, PCE, TCE, and cis-1,2-DCE) were detected in the soil gas sample collected from vapor well VW14. Only chloroform, PCE, and TCE were detected at concentrations exceeding their respective SVSLs based on a 0.03 AF, and only PCE was detected at concentration exceeding its SVSL based on a 0.001 AF at this location. Only two soil gas COCs (benzene and toluene) were detected in the soil gas sample collected from vapor well VW15. Only benzene was detected at a concentration exceeding its SVSL based on a 0.03 AF, but it did not exceed its SVSL based on a 0.001 AF at this location.

6.2.2 Soil

Based on previous investigations, arsenic concentrations in soil exceeding the 17.53 mg/kg background concentration at a depth of 3 feet bgs or less was identified in four areas of the Site with an estimated combined area of approximately 2.6 acres (Figure 2-4). However, the full extent of these areas was not fully defined leading to an overestimation of the amount of arsenic-impacted soil in some areas and an underestimation in other areas. Based on the current and previous investigations, arsenic concentrations in soil exceeding the 17.53 mg/kg background concentration at a depth of 3 feet bgs or less was identified in five areas of the Site with an estimated combined area of approximately 1.7 acres (Figure 4-10).

The two largest areas of arsenic-impacted soil at a depth of 3 feet bgs or less are located south of the Warehouse Building (approximately 0.9 acre) and in the vicinity of the Salvage Building (approximately 0.6 acre). Three smaller areas of arsenic-impacted soil at a depth of 3 feet bgs or less are located in the vicinity of the Tool Issue Building, west of the Hazardous Material Building, and south of the Garage Building (approximately 0.2 acre combined).

Arsenic concentrations exceeding background in soil at a depth greater than 3 feet bgs were identified in three localized areas: south of the east end of the Warehouse Building (approximately 0.3 acre), south of the Tool Issue Building (approximately 0.03 acre) and west of the Salvage Building (approximately 0.02 acre). In the area south of the east end of the Warehouse Building, the vertical extent of arsenic concentrations exceeding background extends to a depth of at least 10 feet bgs in select sampling locations. In the area south of the Tool Issue Building, arsenic concentrations exceeding background extend to a depth between 6 and 11 feet bgs. In the area west of the Salvage Building, the vertical extent of arsenic concentrations exceeding background extend to a depth between 5 and 7.5 feet bgs.

Lead and $TPH_{ho/mo}$ concentrations exceeding their respective 80 and 2,400 mg/kg residential SLs were identified in a localized area within the area of arsenic-impacted soil west of the Salvage Building. The vertical extent of lead and $TPH_{ho/mo}$ concentrations exceeding their residential SLs extend to a depth between 2 and 5 feet bgs.

6.3 Recommendations

Based on the understanding of site conditions following the 2020-2021 site characterization effort and regulatory SLs in effect at the time, recommended next steps include:

- Conducting additional soil gas sampling at existing vapor wells in the summer for comparison to the winter sampling results from the current investigation to evaluate seasonal and temporal variations and support future risk management decisions.
- Conducting sub-slab vapor sampling beneath existing buildings overlying areas where soil gas COCs were detected at concentrations exceeding their SVSLs to evaluate soil vapor conditions beneath the buildings to further develop lines of evidence regarding soil vapor attenuation at the Site.
- Conduct ambient air sampling of onsite subsurface pipe networks (e.g., sewers, drains, etc.) in areas where detected VOC concentrations in soil gas exceed their SVSLs to assess preferential pathway VI potential.
- Conducting additional soil gas characterization to better define the vertical extent of contamination, if necessary, to support remedial design.
- Implementing a remedial action to address VOC concentrations in soil gas that could pose an unacceptable risk to human health should the vapors migrate into indoor.
- Implementing a remedial action to address arsenic concentrations in soil above background levels, and lead and $TPH_{ho/mo}$ concentrations in soil above their respective SLs.

Notes:

Bold indicates analyte exceeds one or more regulatory screening criteria.

bgs = below ground surface

DTSC = California Department of Toxic Substances Control

HERO = Human and Ecological Risk Office

HHRA = human health risk assessment

ID = identification

mg/kg = milligrams per kilogram

NA = not applicable

NE = not established

No. = number

SL = screening level

Goal Compliance:

[a] Residential and commercial/industrial SLs from HERO HHRA Note 3, DTSC-modified SLs (DTSC, 2020).

[b] Site-specific background concentration (AECOM, 2019).

[c] Value corresponds to chromium III.

TABLE 2-4. PREVIOUS INVESTIGATION MAXIMUM ANALYTE CONCENTRATIONS DETECTED IN GROUNDWATER COMPARED TO PRIMARY MAXIMUM CONTAMINANT LEVELS

Notes:
*starting depth is approximate
µg/L = micrograms per liter
bgs = below ground surface
ID = identification
MCL = maximum contaminant level
mg/L = milligrams per liter
NA = not applicable
NE = not established
No. = number
SWRCB = California State Water Resources Control Board
TPH = total petroleum hydrocarbons

Goal Compliance:
[a] California primary MCLs from *MCLs, DLRs, and PHGs for Regulated Drinking Water Contaminants* (SWRCB, 2020).
[b] Primary MCL for sum of total trihalomethanes (bromoform, bromodichloromethane, chlorodibromomethane, and chloroform).
[c] Copper Action Level from *MCLs, DLRs, and PHGs for Regulated Drinking Water Contaminants* (SWRCB, 2020).

TABLE 2-5. HISTORICAL UNDERGROUND STORAGE TANKS

Notes:

Samples were collected using 1.4-liter passivated stainless steel canisters and analyzed by BC Laboratories of Bakersfield, California.

[(a)] VOCs analytes include chlorinated ethanes, chlorinated ethenes, and isopropyl alcohol.

bgs = below ground surface

FD = field duplicate sample

ID = identification

N = normal sample

NA = not applicable

VOC = volatile organic compound

Notes:

Soil samples were collected using a hand auger. Laboratory analyses were performed by BC Laboratories, Inc. of Bakersfield, California.

[a] Depth from top of soil. In paved areas, top of soil is at the bottom of pavement unless indicated otherwise.

[b] Depth from bottom of dock/top of underlying fill material

[c] Depth from top of soil referenced to the surrounding grade.

FD = field duplicate sample
ID = identification
N = normal sample
PCB = polychlorinated biphenyl
SO = soil
SVOC = semivolatile organic compound
TPH = total petroleum hydrocarbons
VOC = volatile organic compound

Notes:

Bold indicates analyte exceeds one or more SVSLs.
Sample depths are referenced to the top of soil (bottom of pavement).
$\mu g/m^3$ = micrograms per cubic meter
CalEPA = California Environmental Protection Agency
DTSC = Department of Toxic Substances Control
ESL = Environmental Screening Level
ID = identification
HERO = Human and Ecological Risk Office
HHRA = human health risk assessment
NA = not applicable
NE = not established
No. = number
SF RWQCB = San Francisco Bay Regional Water Quality Control Board
SVSL = soil vapor screening level
SWRCB = California State Water Resources Control Board

Goal Compliance:

[(a)] Unless noted otherwise, SVSLs were derived by dividing the HERO HHRA Note 3 residential and commercial/industrial ambient air screening levels (DTSC, 2020) by a 0.03 soil vapor attenuation factor (CalEPA, 2020).

[(b)] SVSL derived by dividing the SF RWQCB residential or commercial/industrial indoor air ESLs (SWRCB, 2019) by a 0.03 soil vapor attenuation factor (CalEPA, 2020).

TABLE 4-2. CURRENT INVESTIGATION MAXIMUM ANALYTE CONCENTRATIONS DETECTED IN SOIL GAS COMPARED TO SOIL VAPOR SCREENING LEVELS (0.001 ATTENUATION FACTOR)
(Page 2 of 2)

Analyte	Maximum Concentration (µg/m^3)	Sample ID of Maximum Concentration	Location ID of Maximum Concentration	Sampling Date of Maximum Concentration	Sample Depth (feet)	No. Detections/ Total No. Samples	No. Locations with Detections/ Total No. Locations Sampled	Residential SVSL[a] (µg/m^3)	No. Samples Exceeding Goal/ Total No. Samples	No. Locations Exceeding Goal/ Total No. Locations Sampled	Commercial/ Industrial SVSL[a] (µg/m^3)	No. Samples Exceeding Goal/ Total No. Samples	No. Locations Exceeding Goal/ Total No. Locations Sampled
Total Petroleum Hydrocarbons - Gasoline	1,900,000	SG-VW57B-02	VW57	12/30/2020	14.5	110/110	47/47	600,000[b]	2/110	1/47	2,500,000[b]	0/110	0/47
Total Petroleum Hydrocarbons	1,900,000	SG-VW57B-02	VW57	12/30/2020	14.5	110/110	47/47	NE	NA	NA	NE	NA	NA

Notes:

Bold indicates analyte exceeds one or more SVSLs.
Sample depths are referenced to the top of soil (bottom of pavement).
µg/m^3 = micrograms per cubic meter
CalEPA = California Environmental Protection Agency
DTSC = Department of Toxic Substances Control
ESL = Environmental Screening Level
ID = identification
HERO = Human and Ecological Risk Office
HHRA = human health risk assessment
NA = not applicable
NE = not established
No. = number
SF RWQCB = San Francisco Bay Regional Water Quality Control Board
SVSL = soil vapor screening level
SWRCB = California State Water Resources Control Board

Goal Compliance:

[a] Unless noted otherwise, SVSLs were derived by dividing the HERO HHRA Note 3 residential and commercial/industrial ambient air screening levels (DTSC, 2020) by a 0.001 soil vapor attenuation factor (CalEPA, 2020).
[b] SVSL derived by dividing the SF RWQCB residential or commercial/industrial indoor air ESLs (SWRCB, 2019) by a 0.001 soil vapor attenuation factor (CalEPA, 2020).

TABLE 4-3. CURRENT INVESTIGATION ANALYTES DETECTED IN SHALLOW SOIL GAS COMPARED TO SOIL VAPOR SCREENING LEVELS (0.03 ATTENUATION FACTOR)

Notes:

Only analytes detected in one or more samples are shown.
Analytes detected above one or both SVSLs are shown in **bold**.
Concentrations detected above the laboratory MDL are shown in **bold**.
For non-detects, the value in parentheses corresponds to the laboratory MDL.
Sample depths are referenced to the top of soil (bottom of pavement).
Concentration exceeds residential SVSL.
Concentration exceeds residential and commercial/industrial SVSL.
ND (<MDL) Black inversed cell indicates a non-detect with a laboratory MDL exceeding the commercial/industrial SVSL and/or residential SVSL.
[a] Unless noted otherwise, SVSLs were derived by dividing the HERO HHRA Note 3 residential and commercial/industrial ambient air screening levels (DTSC 2020) by a 0.03 soil vapor attenuation factor (CalEPA, 2020).
[b] SVSL derived by dividing the SF RWQCB residential or commercial/industrial indoor air screening levels (SWRCB, 2019) by a 0.03 soil vapor attenuation factor (CalEPA, 2020).
< = less than
µg/m^3 = micrograms per cubic meter
CalEPA = California Environmental Protection Agency
DTSC = California Department of Toxic Substances Control
FD = field duplicate sample
HERO = Human and Ecological Risk Office
HHRA = human health risk assessment
ID = identification
MDL = method detection limit
N = normal sample
ND = not detected above the laboratory MDL
PQL = practical quantitation limit
QA = quality assurance data validation qualifier
SF RWQCB = San Francisco Bay Regional Water Quality Control Board
SVSL = soil vapor screening level
SWRCB= California State Water Resources Control Board

Data Validation Qualifier Definitions:

J = estimated result
J- = estimated result; potential low bias
UJ = estimated result; analyte not detected at the indicated value

Data Validation Reason Code Definitions:

3D = field duplicate imprecision
4A = canister received at ambient pressure
4D = leak check compound greater than 10 times the lowest PQL; potential leak
6G = reported between the laboratory MDL and PQL

TABLE 4-4. CURRENT INVESTIGATION ANALYTES DETECTED IN SHALLOW SOIL GAS COMPARED TO SOIL VAPOR SCREENING LEVELS (0.001 ATTENUATION FACTOR)

Notes:

Only analytes detected in one or more samples are shown.
Analytes detected above one or both SVSLs are shown in **bold**.
Concentrations detected above the laboratory MDL are shown in **bold**.
For non-detects, the value in parentheses corresponds to the laboratory MDL.
Sample depths are referenced to the top of soil (bottom of pavement).
Concentration exceeds residential SVSL.
Concentration exceeds residential and commercial/industrial SVSL.
ND (<MDL) Black inversed cell indicates a non-detect with a laboratory MDL exceeding the commercial/industrial SVSL and/or residential SVSL.
[a] Unless noted otherwise, SVSLs were derived by dividing the HERO HHRA Note 3 residential and commercial/industrial ambient air screening levels (DTSC 2020) by a 0.001 soil vapor attenuation factor (CalEPA, 2020).
[b] SVSL derived by dividing the SF RWQCB residential or commercial/industrial indoor air screening levels (SWRCB, 2019) by a 0.001 soil vapor attenuation factor (CalEPA, 2020).
< = less than
µg/m^3 = micrograms per cubic meter
CalEPA = California Environmental Protection Agency
DTSC = California Department of Toxic Substances Control
FD = field duplicate sample
HERO = Human and Ecological Risk Office
HHRA = human health risk assessment
ID = identification
MDL = method detection limit
N = normal sample
ND = not detected above the laboratory MDL
PQL = practical quantitation limit
QA = quality assurance data validation qualifier
SF RWQCB = San Francisco Bay Regional Water Quality Control Board
SVSL = soil vapor screening level
SWRCB = California State Water Resources Control Board

Data Validation Qualifier Definitions:

J = estimated result
J- = estimated result; potential low bias
UJ = estimated result; analyte not detected at the indicated value

Data Validation Reason Code Definitions:

3D = field duplicate Imprecision
4A = canister received at ambient pressure
4D = leak check compound greater than 10 times the lowest PQL; potential leak
6G = reported between the laboratory MDL and PQL

TABLE 4-5. CURRENT INVESTIGATION ARSENIC CONCENTRATIONS DETECTED IN SOIL COMPARED TO BACKGROUND
(Page 4 of 4)

				Arsenic
			Units	mg/kg
			Background Concentration[a]	17.53
Location ID	Field Sample ID	Sample Date	Sample Depth (feet bgs)[b]	
Borehole VW38				
VW38	VW38-2	11/24/2020	2	**17**

Notes:

Concentrations detected above the laboratory MDL shown in **bold**.

Concentration exceeds Site-specific background concentration.

[a] Site-specific background concentration (AECOM, 2019).

[b] Depth from top of soil. In paved areas, top of soil is at the bottom of pavement unless indicated otherwise.

[c] Field duplicate analytical result

[d] Depth from bottom of dock/top of underlying fill material

[e] Depth from top of soil referenced to the surrounding grade.

bgs = below ground surface
ID = identification
MDL = method detection limit
mg/kg = milligrams per kilogram

Data Validation Qualifier Definitions:

Refer to Appendix C for qualifier reason codes.
J = estimated concentration
J+ = estimated concentration, potential high bias

TABLE 4-6. CURRENT INVESTIGATION ANALYTE CONCENTRATIONS DETECTED IN VAPOR WELL BOREHOLE AND ASSOCIATED STEP-OUT BOREHOLE SOIL SAMPLES COMPARED TO REGULATORY SCREENING LEVELS AND BACKGROUND

Notes:

Only analytes detected in one or more samples are shown.
Concentrations detected above the laboratory MDL are shown in **bold**.
For non-detects, the value in parentheses corresponds to the laboratory MDL.
Unless otherwise noted, sample depths are referenced to top of soil (bottom of pavement if present).
Concentration exceeds residential SL.
Concentration exceeds residential and commercial/industrial SLs.
Concentration exceeds residential and commercial/industrial SLs and background.
[a] Depth from top of soil. In paved areas, top of soil is at the bottom of pavement unless indicated otherwise.
[b] Residential and commercial/industrial SLs from HERO HHRA Note 3 (DTSC, 2020). Cancer Endpoint *(Non-Cancer Endpoint)*.
[c] Site-specific background concentration (AECOM, 2019).
[d] SL for TPH (C17-C32 Aromatic High)
< = less than
DTSC = California Department of Toxic Substances Control
FD = field duplicate sample
HERO = Human and Ecological Risk Office
HHRA = human health risk assessment
ID = identification
MDL = method detection limit
mg/kg = milligrams per kilogram
N = normal sample
NA = not analyzed
ND = not detected above the laboratory MDL
NE = not established
PCB = polychlorinated biphenyl
PQL = practical quantitation limit
QA = quality assurance data validation qualifier
SL = screening level
TPH = total petroleum hydrocarbons

Data Validation Qualifier Definitions:

J = estimated concentration
J+ = estimated concentration; potential high bias
J- = estimated concentration; potential low bias
UJ = estimated concentration; analyte not detected at the indicated value

Data Validation Reason Code Definitions:

1A = method blank contamination
2B+ = high matrix pike recovery
2B- = low matrix spike recovery
2C- = low surrogate spike recovery
2E+ = high post digestion spike recovery
3C = laboratory duplicate imprecision
3D = field duplicate imprecision
6G = detected between the PQL and MDL
6H = chromatographic pattern of the sample did not resemble the chromatographic pattern of the standard

TABLE 5-1. SUMMARY OF CUMULATIVE RISK AND HAZARD RESULTS FOR THE VAPOR INTRUSION PATHWAY

	Attenuation Factor = 0.03[a]			Attenuation Factor = 0.001[b]		
Receptor	Potential Estimated Cumulative Cancer Risk	Potential Estimated Noncancer Hazard Index	Primary Risk Contributors[c]	Potential Estimated Cumulative Cancer Risk	Potential Estimated Noncancer Hazard Index	Primary Risk Contributors[c]
Resident	**2E-02**	**578**	benzene, BDCM, chloroform, 1,2-DBE, cis-1,2-DCE, ethylbenzene, naphthalene, PCE, TCE, toluene	**7E-04**	**19**	chloroform, 1,2-DBE, cis-1,2-DCE, PCE, TCE
Commercial/ Industrial Worker	**5E-03**	**136**	benzene, BDCM, chloroform, 1,2-DBE, cis-1,2-DCE, 1,2-DCP, naphthalene, PCE, TCE	**2E-04**	**5**	Chloroform, PCE, TCE

Notes:

Cancer risk greater than 1E-06 or noncancer hazard index greater than 1 shown in **bold**.

Cancer risks and noncancer hazards are presented to one significant figure.

[a] Residential and Commercial/Industrial soil vapor screening levels derived using 0.03 attenuation factor (CalEPA, 2020).

[b] Residential and Commercial/Industrial soil vapor screening levels derived using 0.001 attenuation factor (DTSC, 2011).

[c] Primary risk contributors were identified as chemicals contributing to a cumulative cancer risk greater than 1E-06 or noncancer hazard index greater than 1.

BDCM = bromodichloromethane

CalEPA = California Environmental Protection Agency

DBE = dibromoethane

DCE = dichloroethene

DCP = dichloropropane

DTSC = California Department of Toxic Substances Control

PCE = tetrachloroethene

TCE = trichloroethene

3. BDCM SVSLs = 76 $\mu g/m^3$ (Residential) and 330 $\mu g/m^3$ (Commercial/Industrial).
4. CF SVSLs = 120 $\mu g/m^3$ (Residential) and 530 $\mu g/m^3$ (Commercial/Industrial).
5. SVSLs derived using 0.001 attenuation factor.
6. BDCM was not detected in shallow soil gas (4.0'-5.5') at concentrations above SVSLs.

☐	Other:	☐	For Processing

Dear Mr. Salcedo,

SMUD plans to conduct additional soil sampling at the 59th Street Corporation Yard in Sacramento, California, to refine the extent of arsenic impacts in areas where limited shallow soil excavation will be proposed as part of the overall site remedy to be presented in the forthcoming Removal Action Workplan (RAW). Figure 1 (attached) shows the proposed soil sampling locations in four areas (south of the Garage Building, east-northeast of the Tool Issue Building, southeast of the Salvage Building, and west of the Hazardous Materials Building).

Soil samples will be collected at depths of 1.5 and 3.0 feet below ground surface (bgs) at step-out locations approximately 15 feet from previous boreholes KA-44, KA-17, B08, and KA-10. The step-out locations are depicted as blue triangles on Figure 1. The soil samples will be analyzed for arsenic. If arsenic concentrations exceeding the 17.53 milligram per kilogram site-specific background concentration are detected, further step-out sampling may be performed. Sample depths for any further step-out locations will be determined based on the initial step-out soil sample results.

Sampling and analysis procedures will be the same as those described in the Site Characterization and Analysis Plan, SMUD 59th Street Corporation Yard (AECOM 2018). The soil sampling results will be presented in the forthcoming RAW. The sampling event is planned to take place during the week of June 29, 2020. If further step-out sampling is performed, it would likely take place in August 2020. If DTSC would like to be present during sampling, please contact me in advance to coordinate your visit.

Dear Mr. Salcedo,

SMUD plans to conduct additional soil sampling at the 59th Street Corporation Yard in Sacramento, California, to refine the extent of arsenic impacts in areas where limited shallow soil excavation will be proposed as part of the overall site remedy to be presented in the forthcoming Removal Action Workplan (RAW). Figure 1 (attached) shows the proposed soil sampling locations as the Phase 2 proposed soil samples in three areas (east-northeast of the Tool Issue Building, southeast of the Salvage Building, and west of the Hazardous Materials Building). Figure 1 also shows the sample locations and arsenic concentrations from recent sampling at the site during Phase 1 of the step-out location sampling completed on July 29 and July 30, 2020.

Soil samples will be collected at the Phase 2 step-out locations from previous boreholes KA-17, B08, and KA-10 at a depth of 1.5 below ground surface (bgs) at. Additionally, samples may be collected at deeper depths at some locations. The step-out locations are depicted as green triangles on Figure 1. The blue triangles depict the Phase 1 of the step-out location sampling completed on July 29 and July 30, 2020.

Sampling and analysis procedures will be the same as those described in the Site Characterization and Analysis Plan, SMUD 59th Street Corporation Yard (AECOM 2018). The soil sampling results will be presented in the forthcoming RAW. The sampling event is planned to take place on July 20, 2020. If DTSC would like to be present during sampling, please contact me in advance to coordinate your visit.

Dear Mr. Salcedo,

SMUD plans to conduct additional soil sampling at the 59th Street Corporation Yard in Sacramento, California, to refine the extent of arsenic impacts in areas where limited shallow soil excavation will be proposed as part of the overall site remedy to be presented in the forthcoming Removal Action Plan (RAP). Figure 1 (attached) shows the proposed soil sampling locations in the southeast portion of the property in and around the Warehouse Building. Figure 1 also shows the soil sample locations and associated arsenic isoconcentration contours developed from recent sampling at the site.

Soil samples will be collected at the proposed borehole locations indicated by yellow triangles at a depth of 1.5 below ground surface (bgs). The exact location of proposed boreholes may change in the field based upon field conditions and access to locations within the Warehouse Building. Additionally, samples may be collected at deeper depths at some locations.

Sampling and analysis procedures will be the same as those described in the Site Characterization and Analysis Plan, SMUD 59th Street Corporation Yard (AECOM 2018). The soil sampling results will be presented in the forthcoming RAP. The sampling event is planned to take place in November of 2020. If DTSC would like to be present during sampling, please contact me in advance to coordinate your visit.

☐	Other:	☐	For Processing

Dear Mr. Salcedo,

SMUD plans to conduct additional soil sampling within the property boundary of the 59th Street Corporation Yard to refine the extent of the arsenic impacts in areas where limited soil excavations will be proposed as part of the overall site remedy, which will be presented in the forthcoming Removal Action Plan (RAP). Figure 1 (attached) shows the proposed soil sampling locations in the west (adjacent to the Salvage Building) and southeast (adjacent to the Warehouse Building) portions of the property. Figure 1 also shows historical sample locations and associated arsenic isoconcentration contours developed based on the results from recent sampling conducted at the site.

Soil samples will be collected at the proposed characterization borehole locations indicated by red triangles on Figure 1. Exact locations of the proposed boreholes may change in the field based upon field conditions and access. Additionally, samples may also be collected at deeper depths at some locations.

During the installation of soil vapor monitoring wells VM31 and VM35, shallow soil samples were collected at these locations when shallow soil contamination was identified during hand auger activities. In the area of the Savage Building at location VW35, four (4) 15 foot step-out soil samples are proposed to be collected in the north, south, east, and west directions each at a depth of 2 feet below ground surface (bgs) to further define the lateral extent of the current shallow arsenic isoconcentration contour (i.e., 0 to 3 feet bgs). Based on the previous soil sampling results from VW35, arsenic, lead, total petroleum hydrocarbons (TPH) as diesel, and TPH as hydraulic oil/motor oil were all detected at concentrations exceeding the California Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment Note 3 residential screening levels. Therefore, the proposed step-out soil samples will be analyzed for TPH (TPH as diesel and hydraulic oil/motor oil included) by Environmental Protection Agency (USEPA) Method SW8015B and California Administrative Manual (CAM) 17 Metals (arsenic and lead included) by USEPA Methods SW6020 and SW7471A. Additionally, at location VW31, one (1) 15-foot step-out soil sample is proposed to be collected in the south direction at a depth of 2 feet bgs to further define the lateral extent of the current shallow arsenic isoconcentration contour in this

area. This soil sample will be analyzed for CAM 17 Metals (arsenic included) by USEPA Methods SW6020 and SW7471A.

Near the Warehouse Building in the southeastern portion of the site, proposed borehole locations are selected to further define the vertical and lateral extent of the current deep arsenic isoconcentration contour (i.e., 3 to 6 feet bgs), as well as the lateral extent of the current shallow arsenic isoconcentration contour (i.e., 0 to 3 feet bgs). Therefore, one borehole location is proposed slightly east of previous sample location B17, where two (2) soil samples will be collected at depths of 7.5 and 10 feet bgs to further define the vertical extent of arsenic contamination. One borehole location is also proposed north of previous sample location WB06, where three (3) soil samples will be collected at depths of 5, 7.5, and 10 feet bgs to further define the northeastern extent of arsenic contamination. One additional borehole location is proposed east of previous sample location WB07, where three (3) soil samples will be collected at depths of 5, 7.5, and 10 feet bgs to further define the eastern extent of arsenic contamination. All proposed soil samples near the Warehouse Building will be analyzed for CAM 17 Metals (arsenic included) by USEPA Methods SW6020 and SW7471A. In addition, two borehole locations are proposed along the southern edge of the Warehouse Building (north of previous sample locations KA-48 and B11), where three (3) soil samples will be collected at each location at depths of 2 feet above ground surface (consisting of fill material within the loading dock), 1.5 feet bgs, and 5 feet bgs to further define the northern lateral extent of arsenic contamination in this area.

During this additional soil sampling event, a field-portable x-ray fluorescence (XRF) unit is proposed to be utilized to screen for total arsenic concentrations in all soil samples collected in the field prior to submittal to the laboratory for analysis. The XRF field readings may be used to determine if additional step-out borehole locations should be considered to collect additional soil samples at the site.

Sampling and analysis procedures will be the same as those described in the Site Characterization and Analysis Plan, SMUD 59th Street Corporation Yard (AECOM 2018). The soil sampling results will be presented in the forthcoming Site Characterization Report Amendment. The sampling event is planned to take place in February 2021. If DTSC would like to be present during the proposed sampling activities, please contact me in advance to coordinate your visit.

Data Validation Summary and Validated Data Sets

Soil Gas Data Validation Summary

SMUD 59TH STREET CORPORATION YARD SOIL GAS DATA VALIDATION SUMMARY

A total of 108 field soil gas samples and 10 field duplicate (FD) samples were collected at the SMUD 59th Street Corporation Yard in Sacramento, California. The samples were analyzed for volatile organic compounds (VOCs) by United States Environmental Protection Agency (EPA) Toxic Organics (TO)-15 by BC Laboratories, Inc. in Bakersfield, California. The following samples were collected.

- November 30 and December 1, 2020 – Eight well samples analyzed under work order (WO) 2035147
- December 1 and 2, 2020 – 12 well samples and one FD sample analyzed under WO 2035335
- December 2 and 3, 2020 – Eight well samples analyzed under WO 2035539
- December 3 and 4, 2020 – Eight well samples and three FD samples analyzed under WO 2035587
- December 22 and 23, 2020 – 28 well samples and three FD samples analyzed under WO 2037849
- December 23, 29 and 30, 2020 – 22 well samples and two FD samples analyzed under WO 2100036
- March 3, 2021 – 14 system and well samples analyzed under WO 2107219
- March 3 and 4, 2021 – Eight well samples and one FD sample analyzed under WO 2107220

The quality control (QC) samples analyzed to assess contamination, precision, and accuracy for the data sets include method blanks, spikes (laboratory control samples [LCSs] and surrogate spikes) and duplicates (FD and LCS duplicates).

The analytical results were validated against laboratory accuracy and precision limits in accordance with the approved methods. No systematic analytical problems were indicated by the validation process. However, during the validation process, any analytes (detected or not detected) associated with laboratory or field QC samples that do not meet the accuracy or precision limits were flagged by AECOM's project chemist. Non-detect results with estimated practical quantitation limits (PQLs) and potential false negative results are flagged "UJ," detected results that are determined to be from external contamination are flagged as not-detected (U), detected results that are determined to be estimated results are flagged "J" (a "+" or "-" would indicate a potential high or low bias, respectively), and any results (detected or not) that are associated with extreme QC issues are rejected (R) and should not be used per EPA guidance. For this data set, there are no rejected (R) results, estimated results with potential high bias (J+) or blank contamination (U) flagged data results.

Three samples arrived at the laboratory at ambient pressure and three additional samples had elevated levels of isopropanol which was used as one of the leak check compounds. All analytes within these six samples are qualified as potential low bias due to possible dilution with ambient air.

From a total of 9,676 possible results, 1,343 results are qualified. The following bullets summarize the qualified results and Table 1 lists all qualified results.

- Seven hundred and seventy results are qualified as estimated concentrations (J) only because the analyte was detected between the PQL and method detection limit (MDL). These results do not indicate analytical quality issues; the reported results are below the calibration range.
- Two hundred forty-six results (all 82 results in 3 samples [SG-VW14-01, SG-VW32A-02 and SG-VW37B-01]) are qualified as having estimated PQLs (UJ) (188 non-detect results) or estimated results with potential low bias (J-) (58 results) because the canister arrived at the laboratory at ambient pressure. Four of these 246 results are associated with FD imprecision, one is associated with low continuing calibration verification (CCV) recovery and 25 were detected between the PQL and MDL. Sample SG-VW32A-02 is half of an FD pair, and although it was received at ambient pressure, there were no qualifications for FD imprecision.
- Two hundred forty-six results (all 82 results in 3 samples [SG-VW46B-01, SG-VW28B-01 and SG-VW56A-01]) are qualified as having estimated PQLs (UJ) (184 non-detect results) or estimated results with potential low bias (J-) (62 results) because isopropanol was detected at greater than 10 times the lowest PQL indicating a possible leak in the sampling system. One of the 184 non-detect results, is also qualified for low CCV recovery. Twenty-seven of the 62 detected results were reported between the PQL and MDL.

- Sixty-eight results are qualified as having estimated results (J) (64 results) or estimated PQLs (UJ) (4 non-detect results) due to FD imprecision. Fourteen of these detected results were also detected between the PQL and MDL.
- Thirteen additional non-detect results are qualified as having estimated PQLs (UJ) because of low CCV recoveries.
- Samples qualified as estimated (J) because they were detected between the PQL and MDL are not indicative of analytical quality control issues. These results are also flagged by the laboratory. The below table provides all qualified data results.

Notes:
EPA = United States Environmental Protection Agency
MDL = method detection limit
ND = not detected above the MDL
PQL = practical quantitation limit
TPH – Gasoline = total petroleum hydrocarbons as gasoline

Reason Codes:
3D = field duplicate imprecision
4A = sample arrived at ambient pressure
4D = leak check compound greater than ten times the lowest PQL; potential leak
5B = low continuing calibration recovery
6G = reported between the MDL and PQL

EPA Flags:
J = estimated concentration
J- = estimated concentration; potential low bias
UJ = estimated PQL; analyte not detected; potential for false negative result at the PQL

Notes:

Concentrations detected above the laboratory MDL are shown in **bold**.
Sample depths are referenced to the top of soil (bottom of pavement).
< = less than
µg/m^3 = micrograms per cubic meter
FD = field duplicate sample
ID = identification
MDL = method detection limit
N = normal sample
ND = not detected above the laboratory MDL
PQL = practical quantitation limit
QA = quality assurance data validation qualifier
TO = Toxic Organics
TPH = total petroleum hydrocarbons

Data Validation Qualifier Definitions:

J = estimated result
J- = estimated result; potential low bias
UJ = estimated result; analyte not detected at the indicated value

Data Validation Reason Code Definitions:

3D = field duplicate Imprecision
4A = canister received at ambient pressure
4D = sample associated with potential leak in sampling system
5B = low continuing calibration recovery
6G = reported between the laboratory MDL and PQL

Soil Data Validation Summary

SMUD 59TH STREET CORPORATION YARD SOIL DATA VALIDATION SUMMARY

Soil samples were collected from the SMUD Corporation Yard site located at 1708 59th Street in Sacramento, California from June 2020 through February 2021. The samples were analyzed by BC Laboratories, Inc. in Bakersfield, California.

The following samples were analyzed for arsenic only by United States Environmental Protection Agency (EPA) Method 6020.

- June 20-30, 2020 under work order (WO) 2018704: 29 soil samples, three field duplicate (FD) samples, and two project specific matrix spike (MS)/MS duplicates (MSD)
- July 20, 2020 under WO 2020984: 10 soil samples, one FD and one project specific MS/MSD
- August 7, 2020 under WO 2022938: eight soil samples, one FD, and one project specific MS/MSD
- August 26, 2020 under WO 2025110: one soil sample
- December 21, 2020 under WO 2037454: two soil samples
- December 22, 2020 under WO 2037618: 31 soil samples, two FDs, and one project specific MS/MSD

Additional soil samples were collected and analyzed for the following.

- November 23, 2020 under WO 2034585: two soil samples each were analyzed for California Assessment Manual (CAM) 17 metals by EPA Methods 6020 and 7471A, semi-volatile organic compounds (SVOCs) by EPA Method 8270C, volatile organic compounds (VOCs) by EPA 8260B, polychlorinated biphenyls (PCBs) by EPA Method 8082, total purgeable petroleum hydrocarbons by Leaking Underground Fuel Tank-gas chromatography mass spectrometry (LUFT-GCMS); and total petroleum hydrocarbons (TPH) by EPA Method 8015B/Fuel Fingerprint total (FFP). One sample was additionally analyzed for soluble threshold limit concentration (STLC) and toxicity characteristic leaching procedure (TCLP) lead by EPA Method 6010B. One project-specific MS/MSD was analyzed for metals.
- February 22-24, 2021 under WO 2106339: 31 soil samples, four FDs and two project specific MS/MSDs were analyzed for arsenic and 15 soil samples, two FDs and two project-specific MS/MSDs were analyzed for lead by EPA Method 6020. Fifteen soil samples, two FDs and one project specific MS/MSD were also analyzed for TPH by EPA Method 8015B/FFP.

The quality control (QC) samples used to assess contamination, precision, and accuracy for the soil data include blanks (method blanks), spikes (laboratory control samples [LCSs], MS, post digestion, surrogates [organic methods only]), and duplicates (laboratory, LCS duplicates and MSDs). In addition, initial and continuing calibration recoveries, interference check samples (methods 6020 and 6010B only) and calibration blanks (methods 6020, 6010B, and 7471A only) were also reviewed for each analytical batch. The analytical results were validated against laboratory accuracy and precision limits and in accordance with the promulgated method by the AECOM project chemist. Validation is performed to ensure the quality of collected data and to assess limitation on usability, as well as to evaluate laboratory compliance. The data are considered valid and usable for their intended purposes within the constraints of the final usability qualifiers assigned (EPA Flags) in the data quality assessment.

During the validation process, any analytes (detected or not detected) associated with laboratory QC samples that do not meet the accuracy or precision limits were flagged by AECOM's project chemist. Data qualified with the "J" qualifier are considered estimated and usable with acceptable quantitative uncertainty (a "+" or "-" would indicate a potential high or low bias, respectively). Data qualified with the "U" flag are considered not detected; the reported result is attributed to external contamination. The "U" flag may also be assigned to a result that is also qualified as estimated (J). Non-detect results with potential low bias are flagged "UJ". Any results (detected or not) that are associated with extreme QC issues are rejected (R) and should not be used per EPA guidance.

From a total of 533 possible results (field and FD samples), 224 results are qualified. The following bullets summarize the qualified results and Table 1 lists all qualified results. Samples qualified as estimated (J) because they were detected between the PQL and MDL or (J) because the chromatographic pattern did not match the standard pattern (TPH only) are not indicative of analytical quality control issues. These results are also flagged by the laboratory. A summary of the qualified data is provided in the bullets below.

- For SVOCs by EPA Method 8270C, all sample results in both samples (172 non-detect results) are rejected (R). The calibration check compound (CCC) (pentachlorophenol) exceeded the relative standard deviation (RSD) of 30% specified in the method. According to the method, "*high variability for these compounds may be indicative of system leaks or reactive sites on the column. If the RSD of any CCC is greater than 30%, then the chromatographic system is too reactive for analysis to begin."* Two of these results are also associated with low continuing calibration verification recoveries.
- For VOCs by EPA Method 8260B, five results are qualified. Four non-detect results are qualified as estimated PQLs (UJ) because of low initial calibration verification recoveries and one result is qualified as an estimated concentration (J) because it was detected between the PQL and MDL.
- For TPH by EPA Method 8015B/FFP, three diesel and 13 motor oil results are qualified as estimated concentrations (J) because the sample chromatographic pattern did not match the chromatographic pattern of their respective standards. In addition, diesel in two samples and motor oil in three samples were detected between the PQL and MDL. Two of these motor oil results are also qualified for field duplicate imprecision.
- For PCBs by EPA Method 8082, 10 results are qualified. Two results are qualified as estimated concentrations because they were detected between the PQL and MDL. All eight results (two detected and six non-detect results) in sample VW-35-2 are qualified as estimated concentrations with potential low bias (J-) or estimated PQLs (UJ), respectively because of a low surrogate spike recovery. The two detected results were also detected between the PQL and MDL.
- For metals by EPA Method 6020, 18 results are qualified. Six results are qualified as estimated concentrations (J) only because they were detected between the PQL and MDL. Four results are qualified as estimated concentrations with potential low bias (J-) because of low MS recoveries, four results are qualified as estimated concentrations (J) due to FD imprecision, two results are qualified as estimated concentrations with potential high bias (J+) due to high post digestion recovery, one result is qualified as an estimated concentration (J) due to both a high and low MS recovery, and one additional result is qualified for laboratory duplicate imprecision. The interference check sample (noted as IFA and IFB) results in the data package, analyzed for metals, indicated metal analytes did not meet the limits. No analytes were qualified; the laboratory provided the following response: *"With regard to the IFA/B results, apparently the CLP reporting program is putting a star on values whose absolute value is greater than the value of the PQL. The concentration for all the analytes that do not have a true value listed in the "True" column is zero; they are not spiked in either IFA or IFB. Other than Se, these are common contaminants in the IFA/B solutions that cannot be avoided in the manufacturing. We allow them to go up to 2X the PQL in the negative direction for acceptable limits so Se is still OK. The high 130% recovery for Zn is because of the amount of Zn in the IFA solution which is a known contaminant. When this amount is subtracted from the IFB solution the spike amount is recovered at 91%. The LIMS we use will not do that calculation and for that matter there are no recovery limits for the spiked compounds in EPA Method 6020. We have the DOD limits of 80 – 120% in the system for samples that come from DOD clients."*
- For TCLP lead analyzed by EPA Method 6010B, one result is qualified as an estimated concentration (J) because it was detected between the PQL and MDL.
- For mercury by EPA Method 7471A, two results are qualified for blank contamination. One result is flagged as an estimated concentration for potential high bias (J+) and the other is flagged as not detected (UJ).

TABLE 1. QUALIFIED DATA

TCLP/EPA 6010B (mg/L)							
VW-35-2	11/23/2020	Lead	0.052	0.50	0.03	J	6G

Notes:

BHC = benzenehexachloride (hexachlorocyclohexane)
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethene
DDT = dichlorodiphenyltrichloroethane
EPA = United States Environmental Protection Agency
FFP = Fuel Fingerprint total
MDL = method detection limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
ND = not detected above the MDL
PCB = polychlorinated biphenyl
PQL = practical quantitation limit
TCLP = Toxicity Characteristic Leaching Procedure
TPH = total petroleum hydrocarbons

EPA Flags (U and J flags can be combined):

J = estimated concentration
J+ = estimated concentration; potential high bias
J- = estimated concentration; potential low bias
R = rejected
U = associated with external contamination
UJ = analyte not detected; estimated PQL and potential for false negative result at the PQL

Reason Codes:

1A = method blank contamination
2B+ = high matrix pike recovery
2B- = low matrix spike recovery
2C- = low surrogate spike recovery
2E+ = high post digestion spike recovery
3C = laboratory duplicate imprecision
3D = field duplicate imprecision
5A = initial calibration failed
5A- = low initial calibration verification recovery
5B- = low continuing calibration verification recovery
6G = detected between the PQL and MDL
6H = chromatographic pattern of the sample did not resemble the chromatographic pattern of the standard

Notes:

Concentrations detected above the laboratory MDL are shown in **bold**.
Sample depths are referenced to the top of soil. In paved ares, top of soil is at the bottom of pavement unless indicated otherwise.
*Depth from bottom of dock/top of underlying fill material.
< = less than
BHC = benzenehexachloride
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethene
DDT = dichlorodiphenyltrichloroethane
FD = field duplicate sample
FFP = fuel fingerprint
GC/MS = gas chromatograph/mass spectrometer
ID = identification
LUFT = leaking underground fuel tank
MDL = method detection limit
mg/kg = milligrams per kilogram
mg/L = milligrams per liter
N = normal sample
ND = not detected above the laboratory MDL
PCB = polychlorinated biphenyl
PQL = practical quantitation limit
QA = quality assurance data validation qualifier
STLC = soluble threshold limit concentration
TCLP = Toxicity Leaching Characteristic Procedure
TPH = total petroleum hydrocarbons

Data Validation Qualifier Definitions:

J = estimated result
J+ = estimated concentration; potential high bias
J- = estimated concentration; potential low bias
R = rejected due to quality control failure
UJ = estimated concentration; analyte not detected at the indicated value

Data Validation Reason Code Definitions:

1A = method blank contamination
2B+ = high matrix pike recovery
2B- = low matrix spike recovery
2C- = low surrogate spike recovery
2E+ = high post digestion spike recovery
3C = laboratory duplicate imprecision
3D = field duplicate imprecision
5A = initial calibration failed
5A- = low initial calibration verification recovery
5B- = low continuing calibration verification recovery
6G = detected between the PQL and MDL
6H = chromatographic pattern of the sample did not resemble the chromatographic pattern of the standard

Case Narrative

Sample Receipt

Work Order: 2035147
COC Number:
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A1
EPA-TO-15	MS-A2

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

The internal standard on the Initial Calibration Verification (ICV) was not within the control limits.

Lab Number	Method	Analyte
2022100-ICV2	EPA-TO-15	Chlorobenzene-d5 (IS)

LCS / LCSD

The LCS recoveries were within QC limits.

Lab Number	Receipt Pressure	Units
20-35147-01	13.3	PSIA

Notes and Definitions

B	Blank contamination. The analyte is greater than 1/2 the PQL/LOQ/CRQL in the associated method blank.
D	The reported value is from a dilution.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration.
J	The reported value is an estimated value. Results are between the MDL and PQL/LOQ/CRQL.
U	The analyte was not detected and is reported as less than the LOD/MDL or as defined by the client.

Case Narrative

Sample Receipt

Work Order: 2035335
COC Number:
Cooler 2 was received at 25 °C
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A1
EPA-TO-15	MS-A2

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

The internal standard on the Initial Calibration Verification (ICV) was not within the control limits.

Lab Number	Method	Analyte
2022116-ICV2	EPA-TO-15	Chlorobenzene-d5 (IS)

LCS / LCSD

The LCS recoveries were within QC limits.

Discussion

Method TO-15 canister with sample ID 2035335-08 came into the lab at ambient pressure

Notes and Definitions

B	Blank contamination. The analyte is greater than 1/2 the PQL/LOQ/CRQL in the associated method blank.
D	The reported value is from a dilution.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration.
J	The reported value is an estimated value. Results are between the MDL and PQL/LOQ/CRQL.
U	The analyte was not detected and is reported as less than the LOD/MDL or as defined by the client.

Case Narrative

Sample Receipt

Work Order: 2035539
COC Number:
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A1

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

Initial calibration criteria for respective analysis were met. Frequency criteria for initial and continuing calibrations were met. Accuracy criteria for initial and continuing calibrations were met.

LCS / LCSD

The LCS recoveries were within QC limits.

Notes and Definitions

B	Blank contamination. The analyte is greater than 1/2 the PQL/LOQ/CRQL in the associated method blank.
D	The reported value is from a dilution.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration.
J	The reported value is an estimated value. Results are between the MDL and PQL/LOQ/CRQL.
U	The analyte was not detected and is reported as less than the LOD/MDL or as defined by the client.

Case Narrative

Sample Receipt

Work Order: 2035587
COC Number:
Cooler 2 was received at 25 °C
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A2

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

The internal standard on the Initial Calibration Verification (ICV) was not within the control limits.

Lab Number	Method	Analyte
2022140-ICV2	EPA-TO-15	Chlorobenzene-d5 (IS)

LCS / LCSD

The LCS recoveries were within QC limits.

Discussion

Method TO-15 canister with sample ID 2035587-04 came into the lab at ambient pressure

AECOM - Sacramento
2020 L St, Suite 400
Sacramento, CA 95811

Reported: 12/23/2020 12:48:54PM
Project: SMUD 59th St. SVM Air Sampling-CLP III
Project Number: 60632793.06
Project Manager: Andy Shepard

* Holding time not met

Note: If Prep or Analysis are performed within the hour (if holding time is based on hours) or within the day (if holding time is based on days), then the sample is not flagged as outside holding times. Calculated number of days are based on date received or date prepared depending on the test.

AECOM - Sacramento
2020 L St, Suite 400
Sacramento, CA 95811

Reported: 12/23/2020 12:48:54PM
Project: SMUD 59th St. SVM Air Sampling-CLP III
Project Number: 60632793.06
Project Manager: Andy Shepard

Notes and Definitions

B	Blank contamination. The analyte is greater than 1/2 the PQL/LOQ/CRQL in the associated method blank.
D	The reported value is from a dilution.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration.
J	The reported value is an estimated value. Results are between the MDL and PQL/LOQ/CRQL.
U	The analyte was not detected and is reported as less than the LOD/MDL or as defined by the client.

Case Narrative

Sample Receipt

Work Order: 2037849
COC Number:
Cooler 2 was received at 25 °C
Cooler 3 was received at 25 °C
Cooler 4 was received at 25 °C
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A1

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

The internal standard on the sample was not within the control limits.

Lab Number	Method	Analyte
2100148-CAL7	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CAL8	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CAL9	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CALA	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CALB	EPA-TO-15	Chlorobenzene-d5 (IS)

The Continuing Calibration Verification (CCV) recovery was not within established control limits.

Lab Number	Method	Analyte
2100086-CCV1	EPA-TO-15	t-Amyl Methyl ether
2100086-CCV1	EPA-TO-15	Ethyl t-butyl ether
2100086-CCV3	EPA-TO-15	Ethyl t-butyl ether
2100182-CCV1	EPA-TO-15	t-Amyl Methyl ether
2100182-CCV1	EPA-TO-15	Ethyl t-butyl ether
2100182-CCV3	EPA-TO-15	t-Amyl Methyl ether
2100182-CCV3	EPA-TO-15	Ethyl t-butyl ether

LCS / LCSD

The LCS recoveries were within QC limits.

Discussion

Method TO-15 canister with sample ID 2037849-01 came into the lab at ambient pressure.

Notes and Definitions

B	Blank contamination. The analyte is greater than 1/2 the PQL/LOQ/CRQL in the associated method blank.
D	The reported value is from a dilution.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration.
J	The reported value is an estimated value. Results are between the MDL and PQL/LOQ/CRQL.
U	The analyte was not detected and is reported as less than the LOD/MDL or as defined by the client.

Case Narrative

Sample Receipt

Work Order: 2100036
COC Number:
Cooler 2 was received at 25 °C
Cooler 3 was received at 25 °C
Default Cooler was received at 25 °C
Samples were checked for preservation. Where applicable, sample preservation was adjusted in the laboratory.

Requested Analysis

Method	Instrument
EPA-TO-15	MS-A1

Sample Qualifier Summary

There were no qualifiers for the samples.

Holding Times

All holding time requirements were met.

Method Blanks

There were no detections in the Method Blank(s).

Calibration

The internal standard on the sample was not within the control limits.

Lab Number	Method	Analyte
2100148-CAL7	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CAL8	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CAL9	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CALA	EPA-TO-15	Chlorobenzene-d5 (IS)
2100148-CALB	EPA-TO-15	Chlorobenzene-d5 (IS)

The Continuing Calibration Verification (CCV) recovery was not within established control limits.

Lab Number	Method	Analyte
2100368-CCV1	EPA-TO-15	t-Amyl Methyl ether
2100368-CCV1	EPA-TO-15	Ethyl t-butyl ether
2100446-CCV1	EPA-TO-15	Hexachlorobutadiene
2100448-CCV1	EPA-TO-15	Hexachlorobutadiene

LCS / LCSD

The LCS recoveries were within QC limits.

Discussion

Method TO-15 canister with sample ID 2100036-18 came into the lab at ambient pressure.
